Biocontrol for Nature Symposium

Hydrilla verticillata

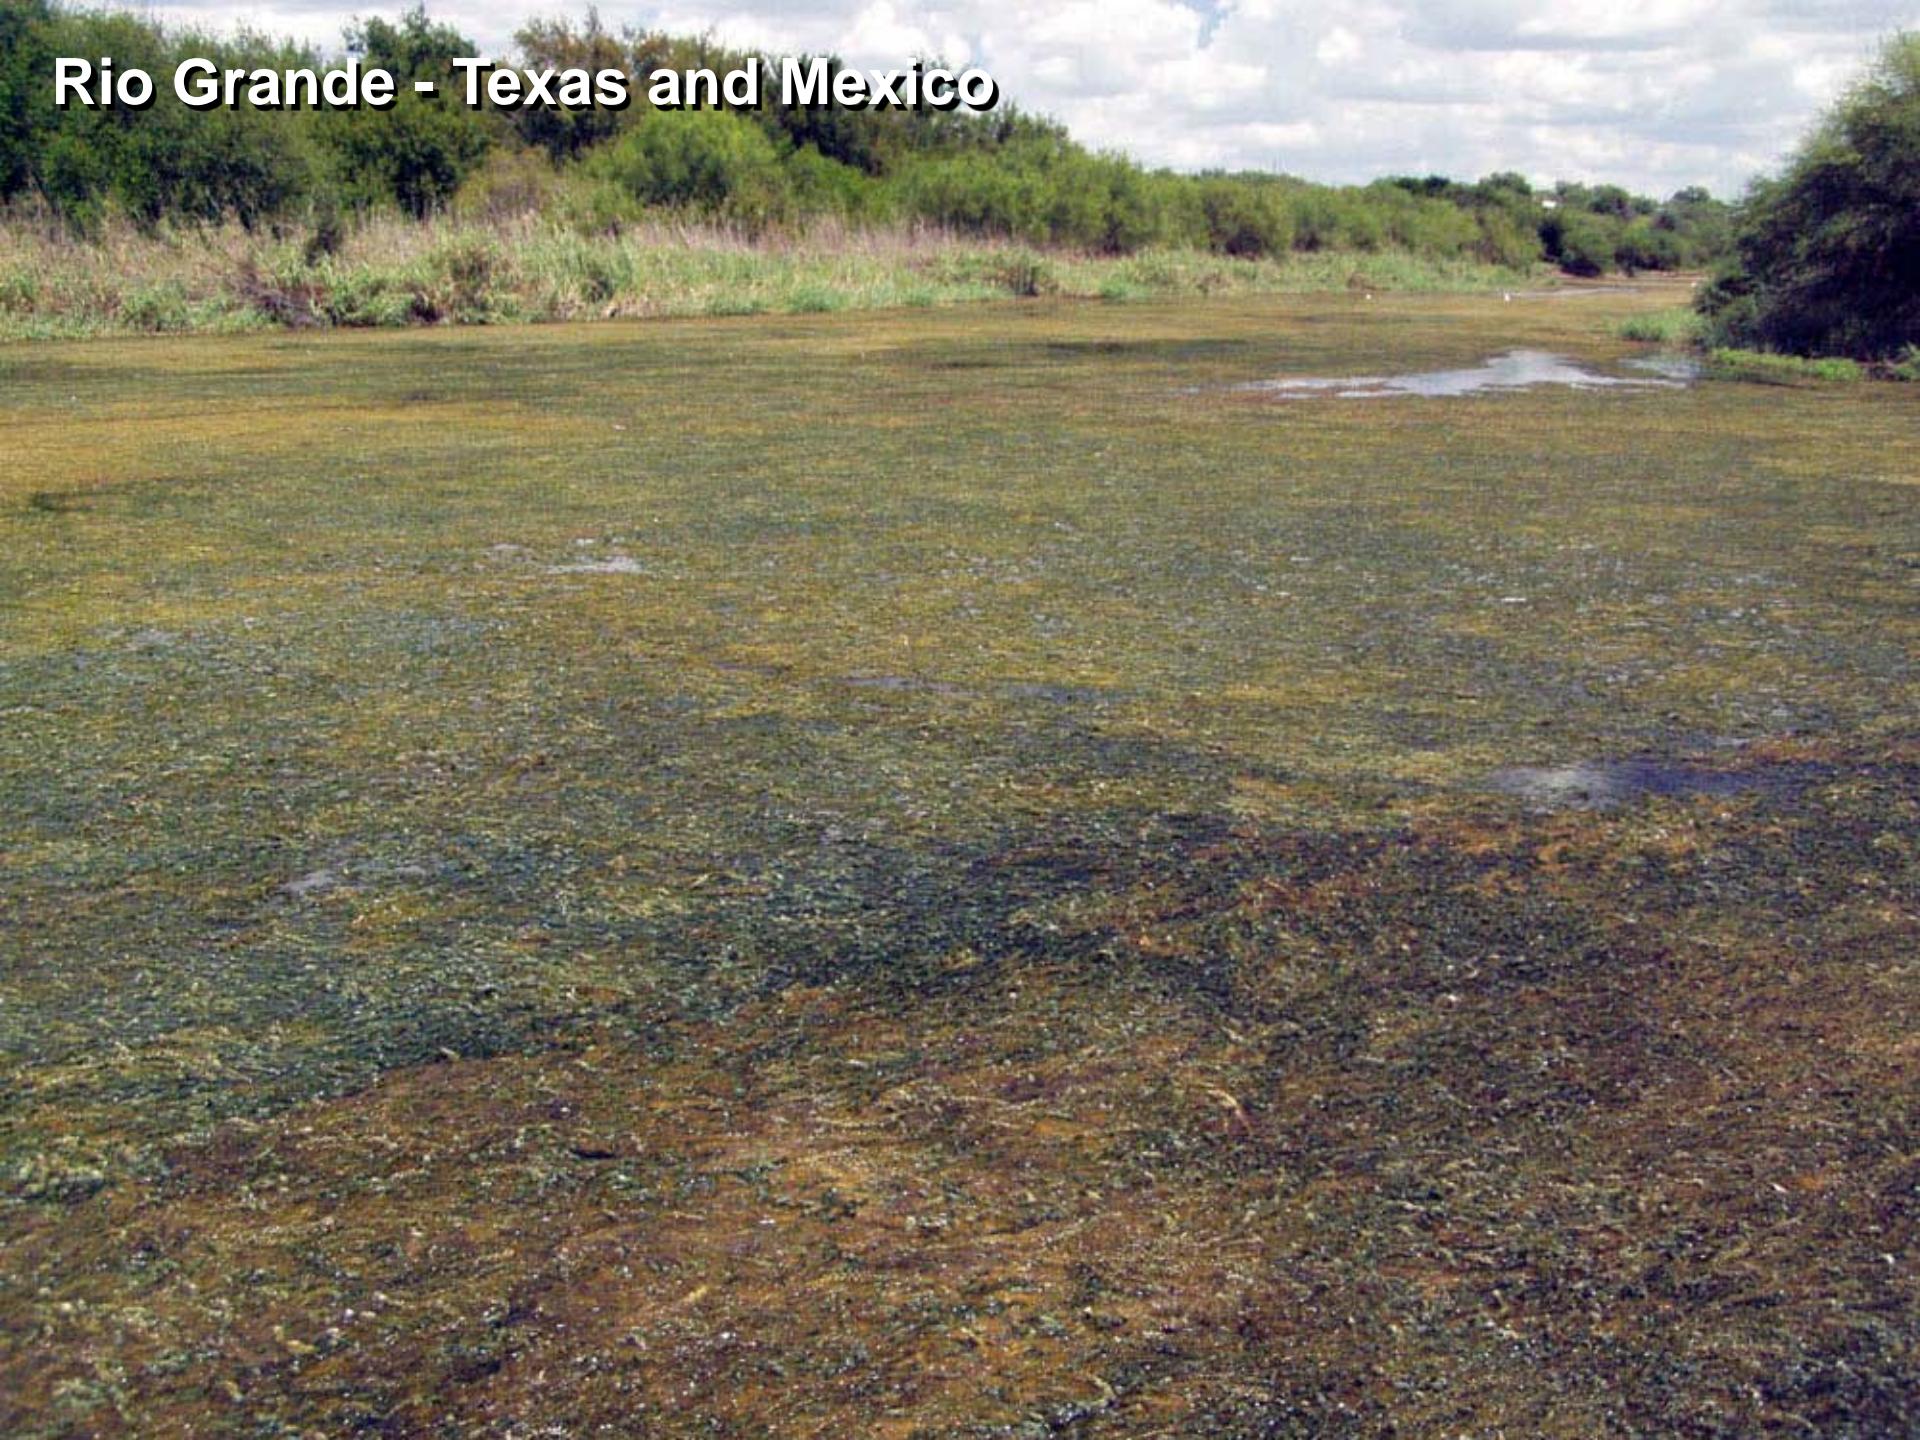

- First introduced in Florida
- 1950's – aquarium trade
- Asia, Africa, Australia
- Submersed plant
- Rooted in sediment
- Forms extensive mats
- Tubers and turions
 - Extended survival
- US Problem
 - Southeast
 - California
 - East/West Coast

Low

Grow Time

Short/Warm

Long/Cool

Nutritional composition of hydrilla following growth under different treatment combinations

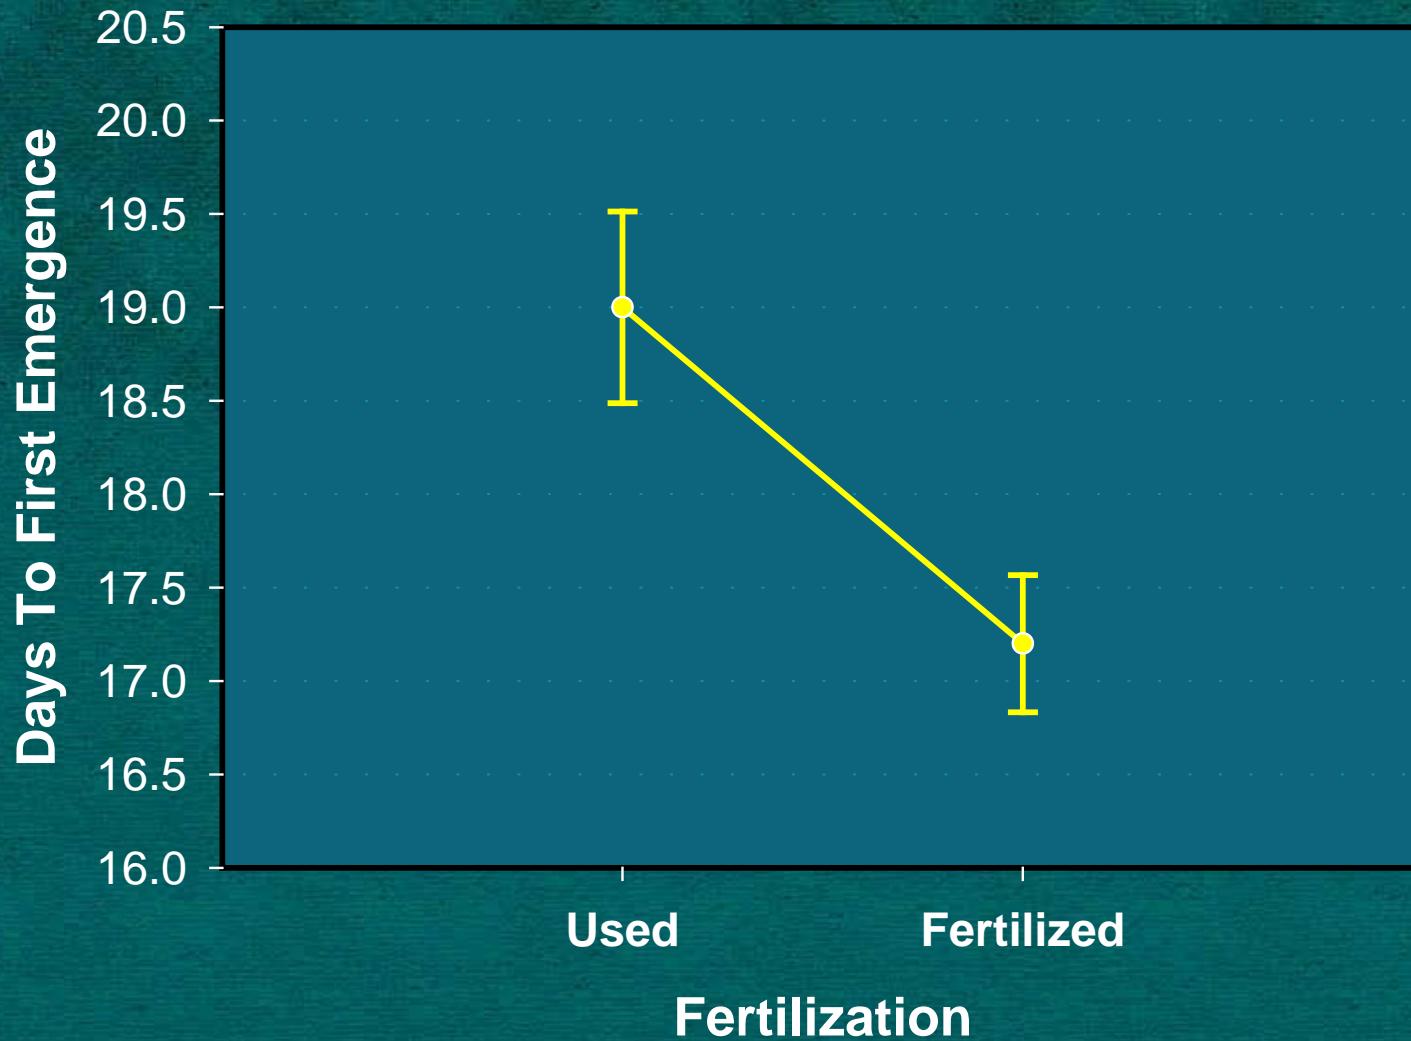

Methods

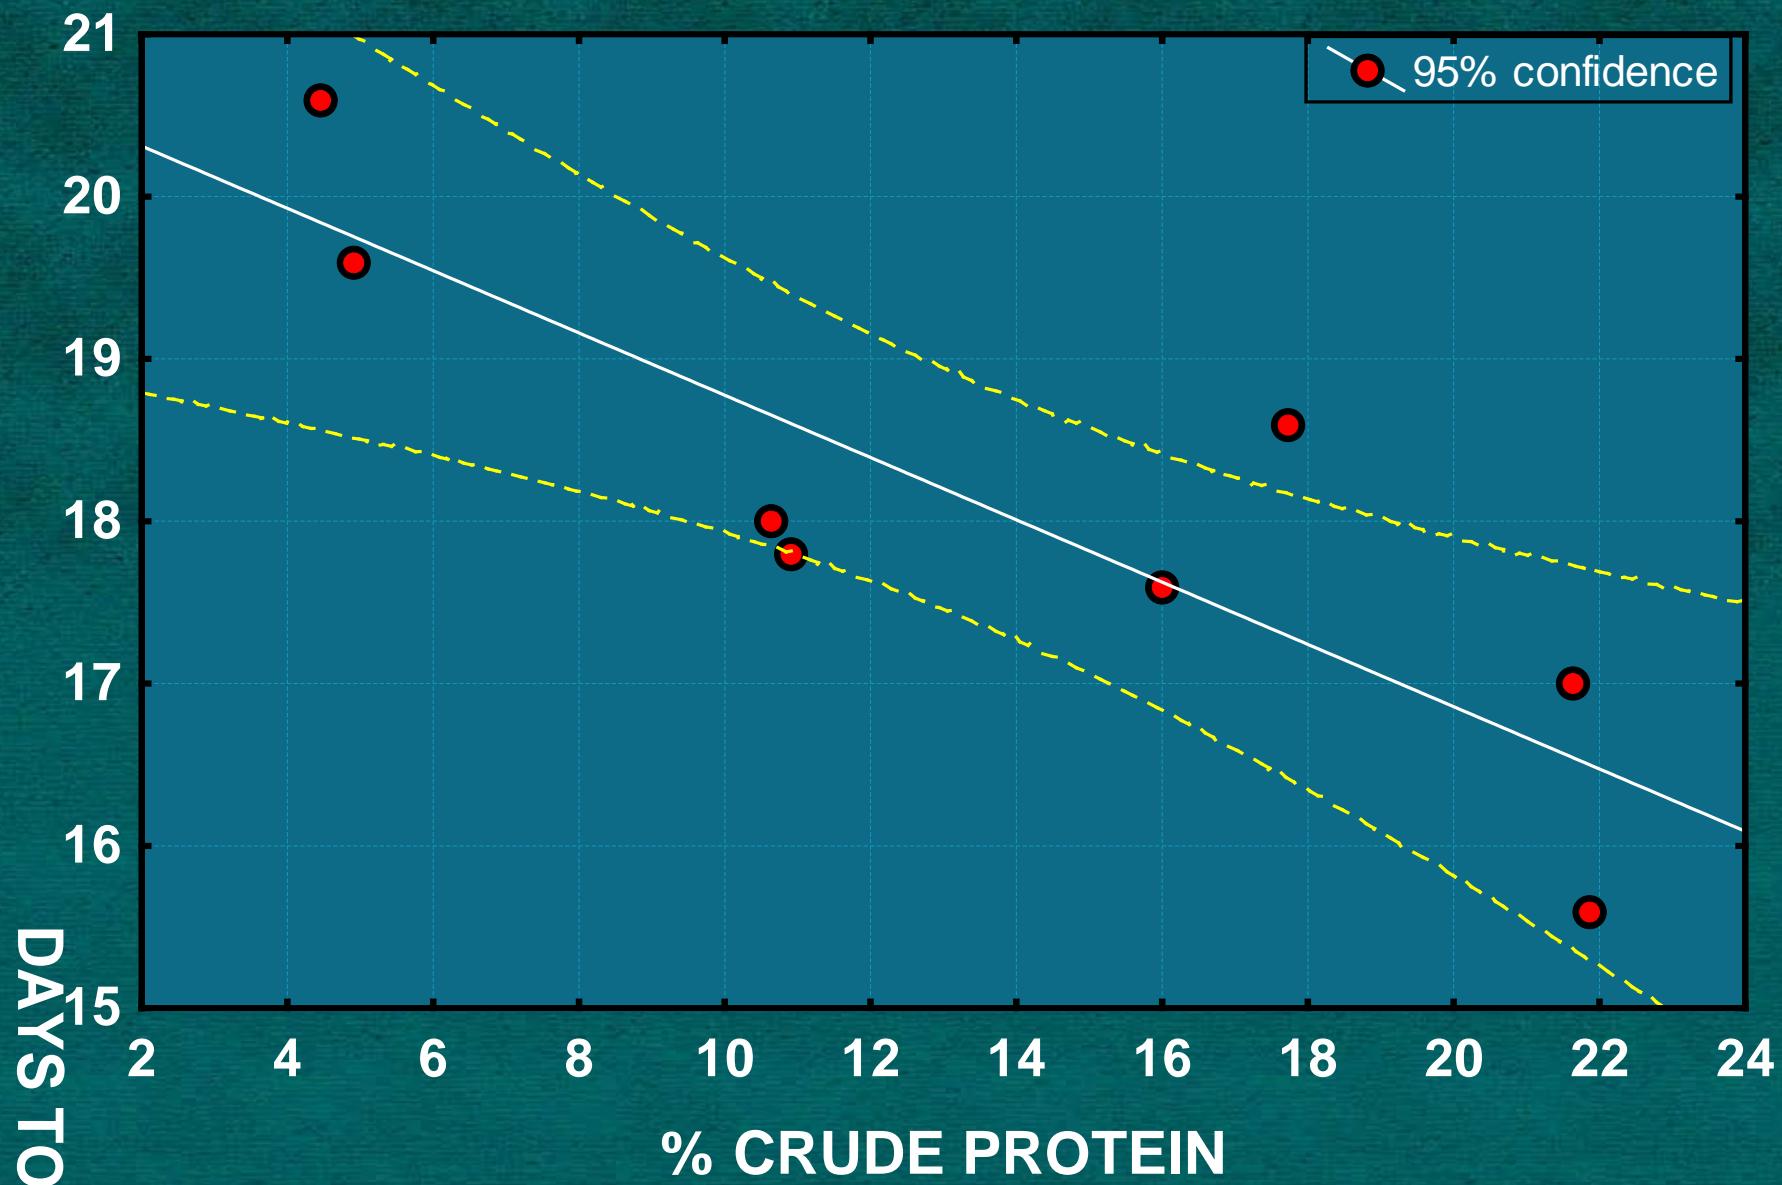

- In each container:
 - 40 g hydrilla
 - 50 eggs
- Adults removed as emerged
- Small oviposition boxes
 - Counted eggs
 - Assessed crowding
 - Determined fly weight

Days to First Emergence Various fertilization levels

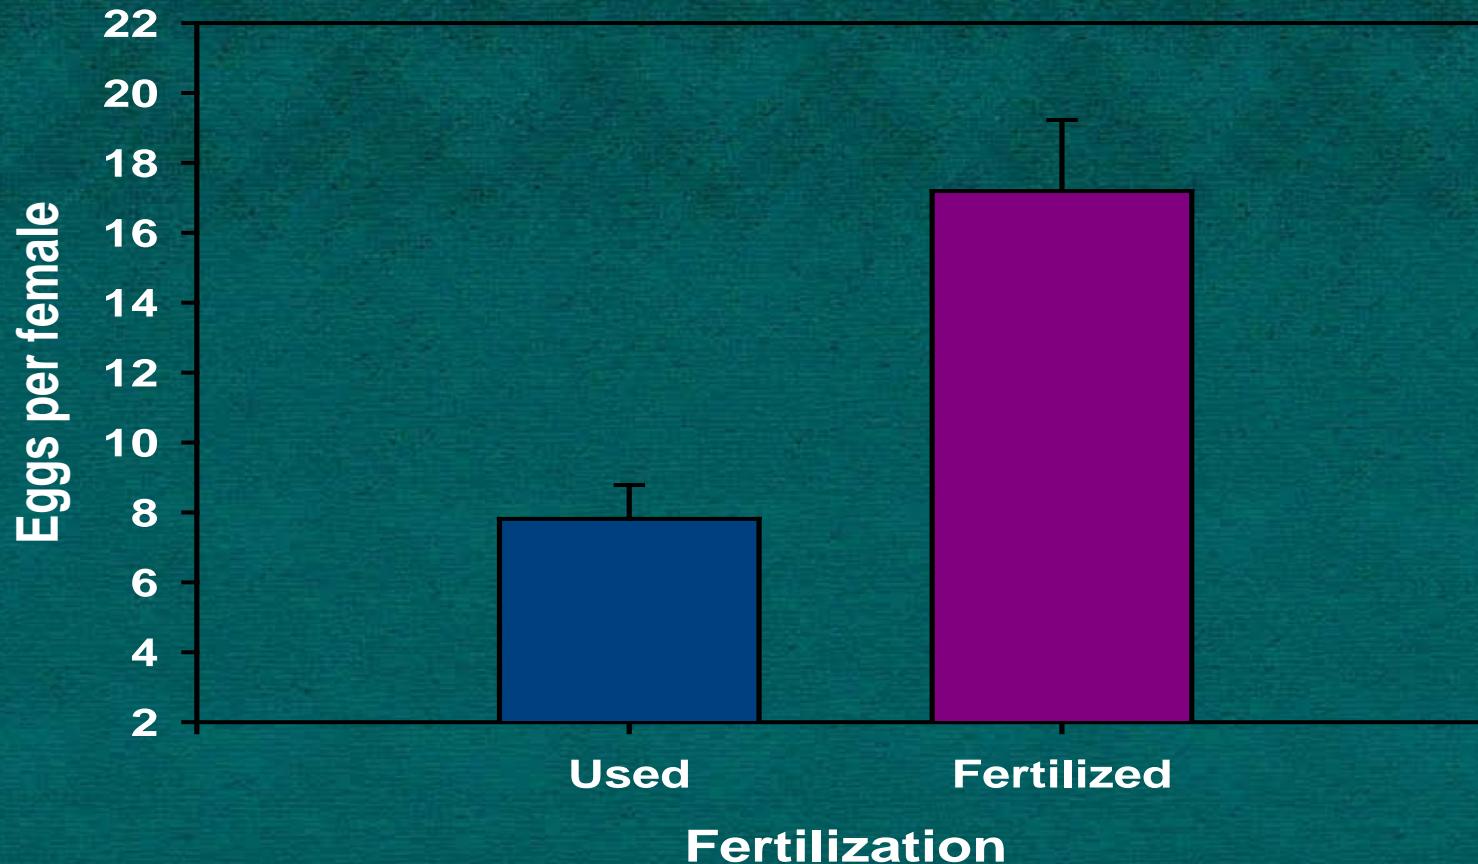

Correlation: $r = -.8573$

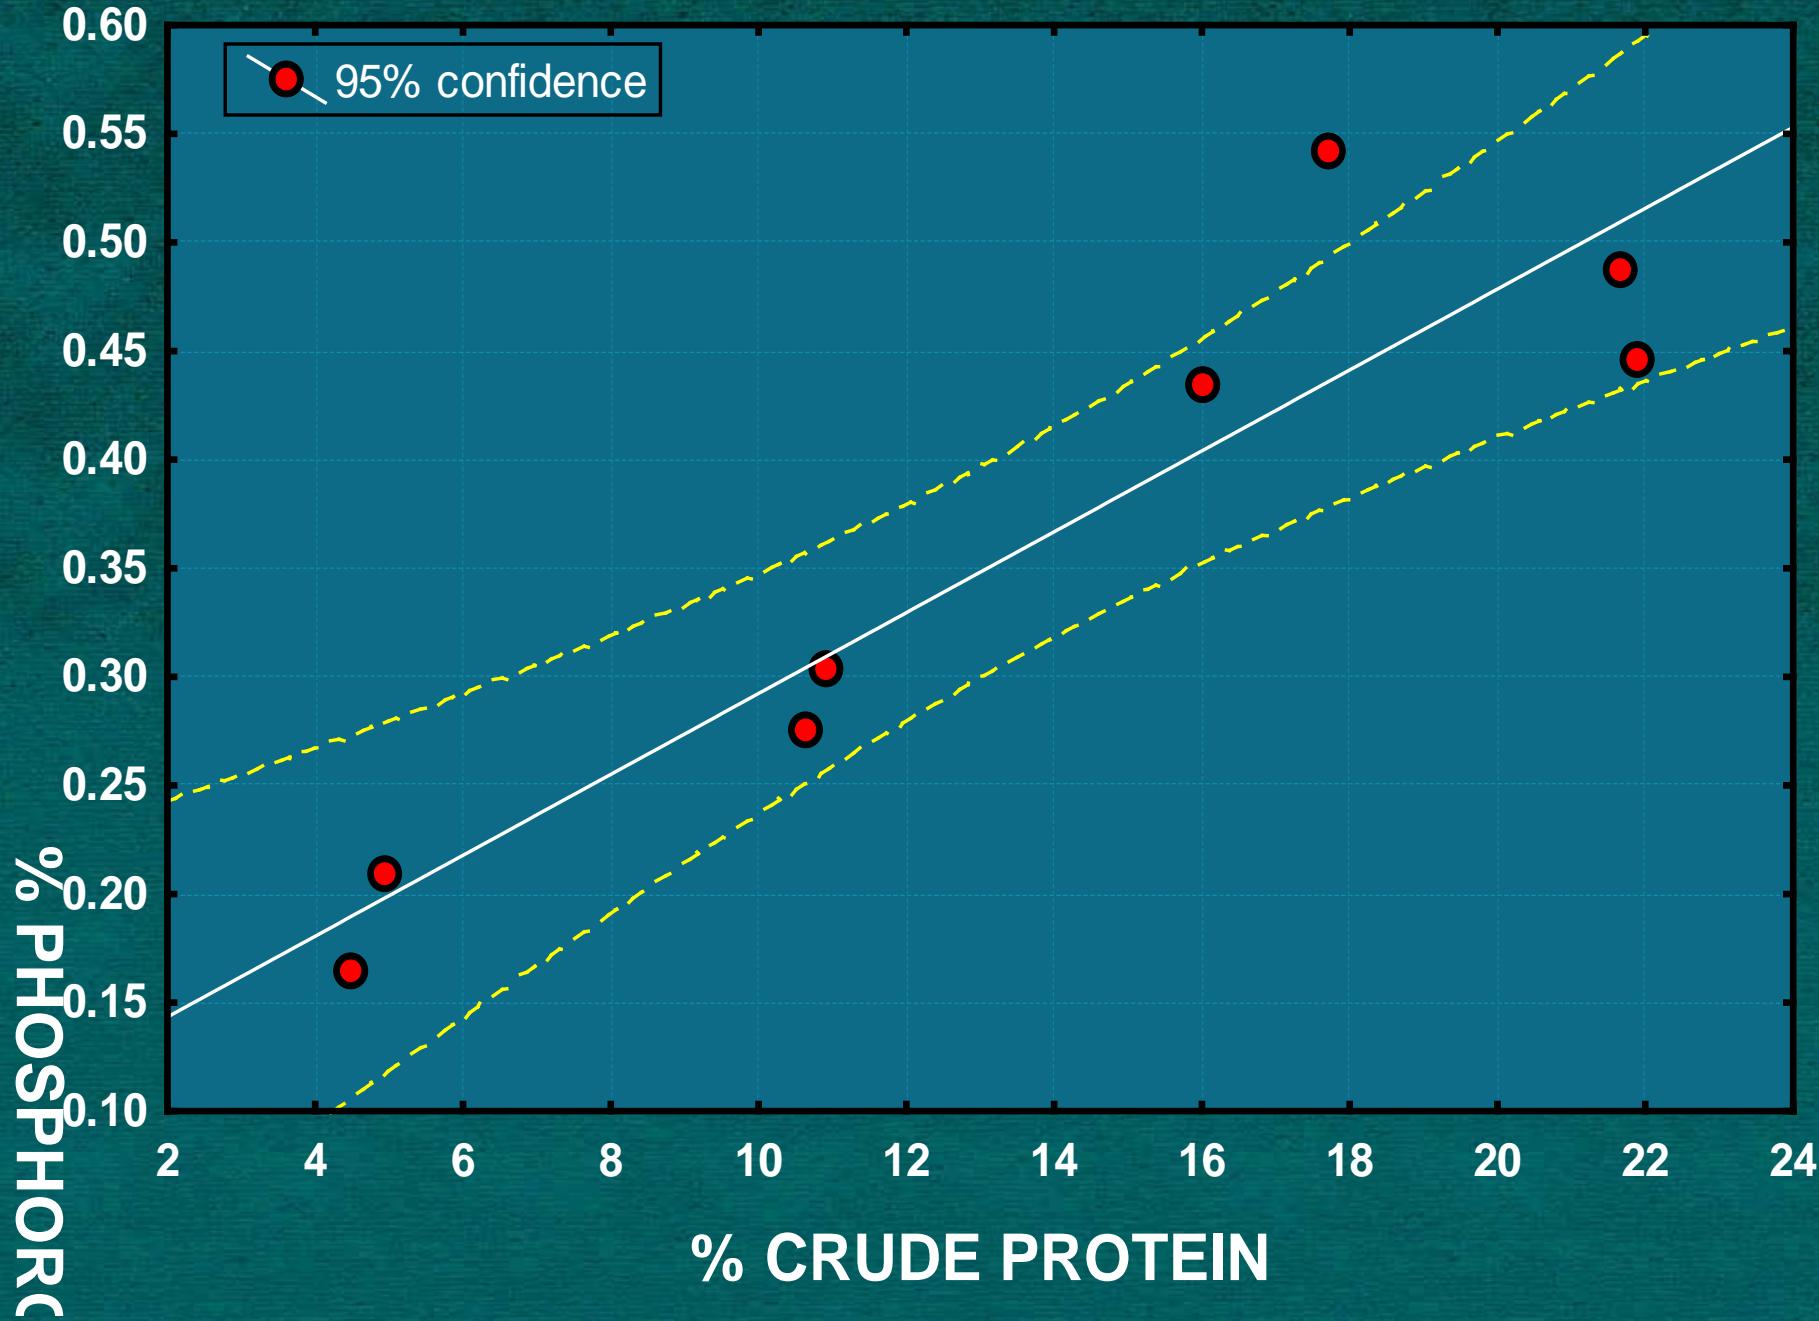

Eggs Per Female

Various fertilization levels

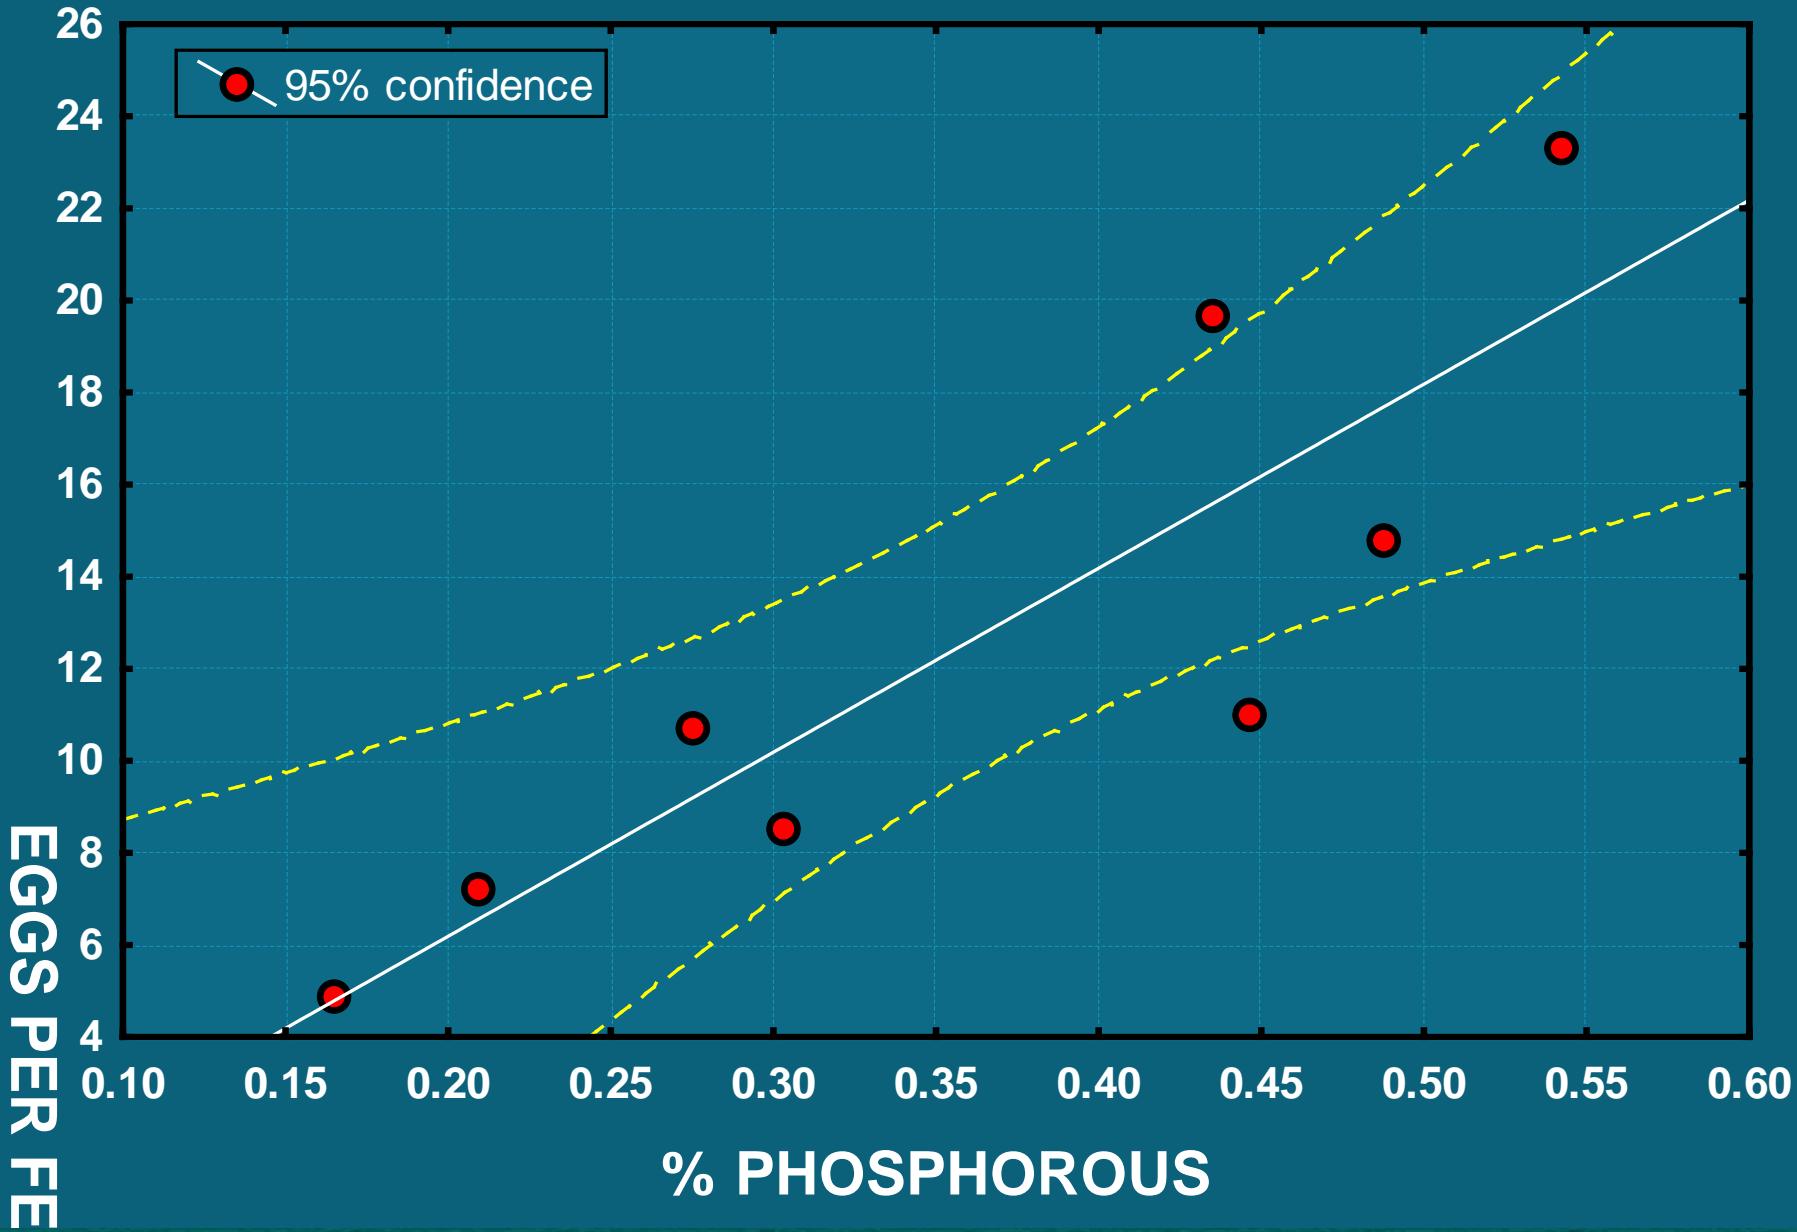

Eggs per female for different fertilization levels.

Correlation: $r = .92688$

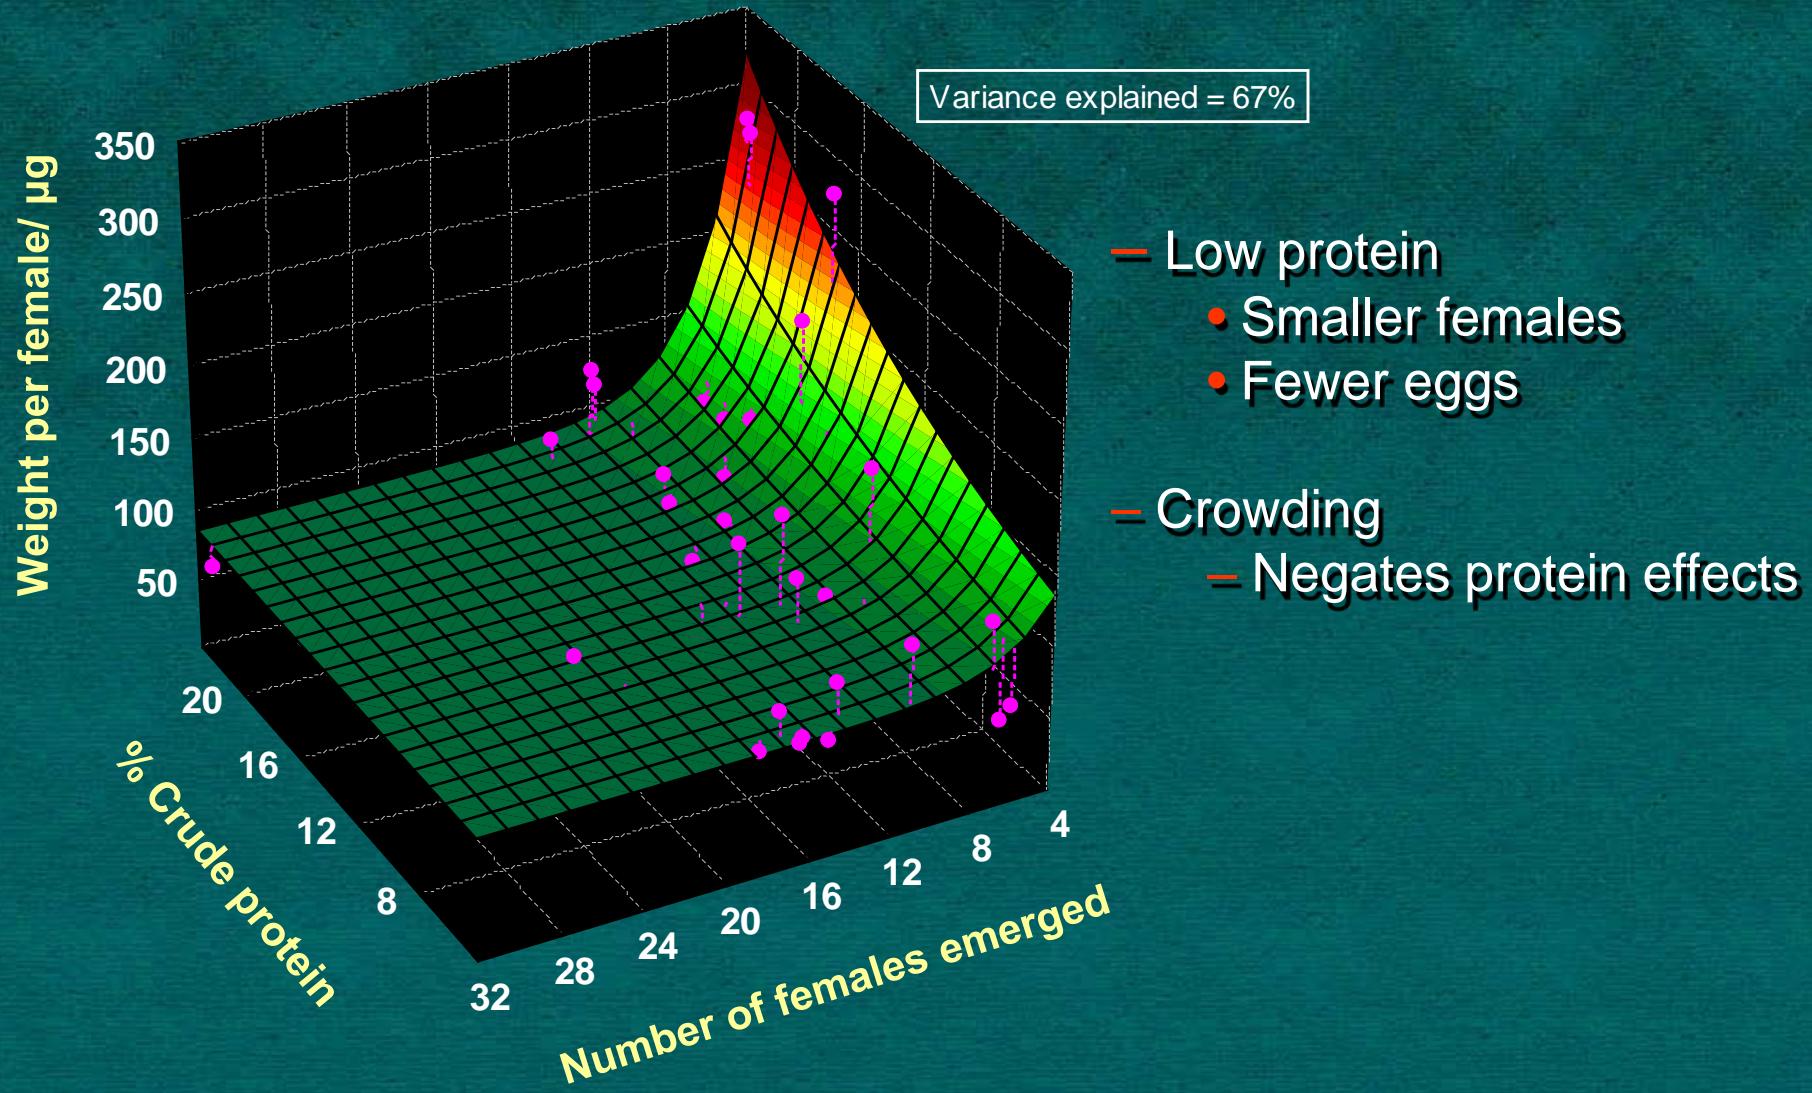

Correlation: $r = .86985$

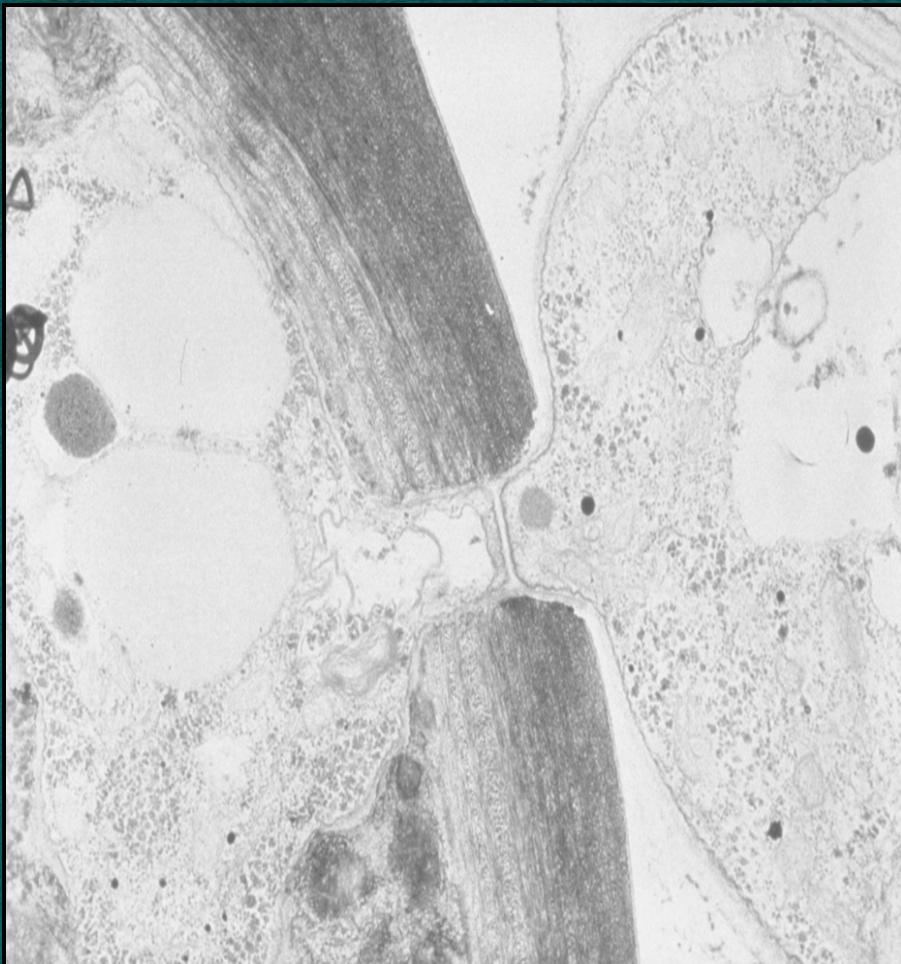

Nutritional influences

Model: Exponential growth ($y=c+\exp(b_0+b_1*x_1+b_2*x_2 \dots)$)

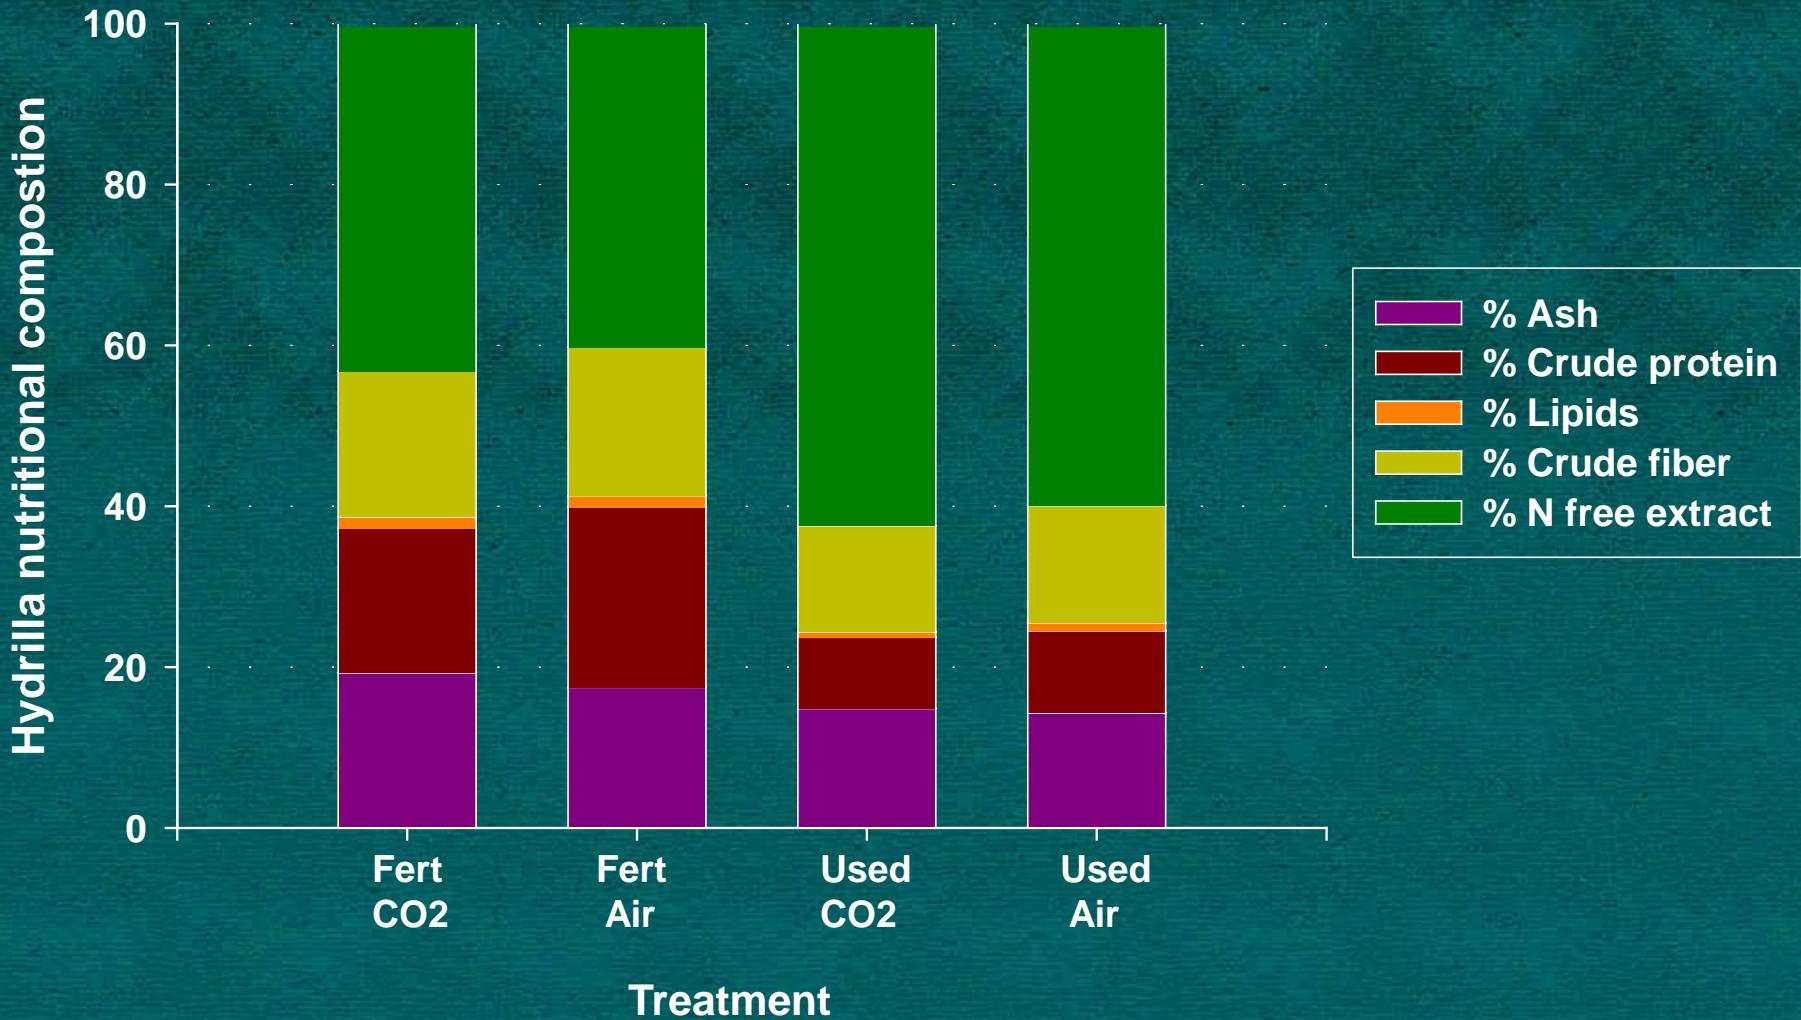

$$z=84.5538+\exp(5.26134+(.081049)*x+(-.41639)*y)$$

Pathogen Experiment

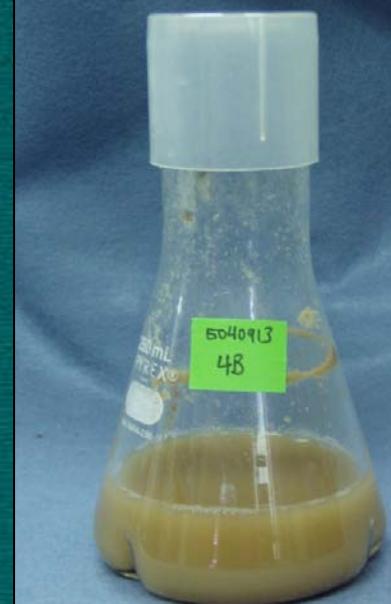

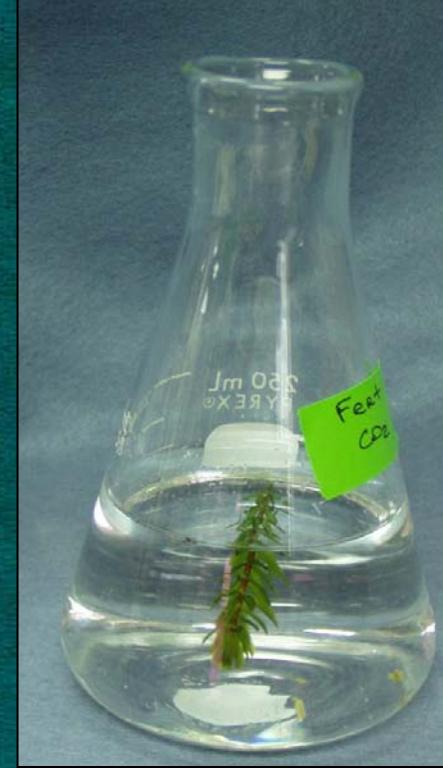

Nutritional composition of hydrilla grown under different treatment regimes.

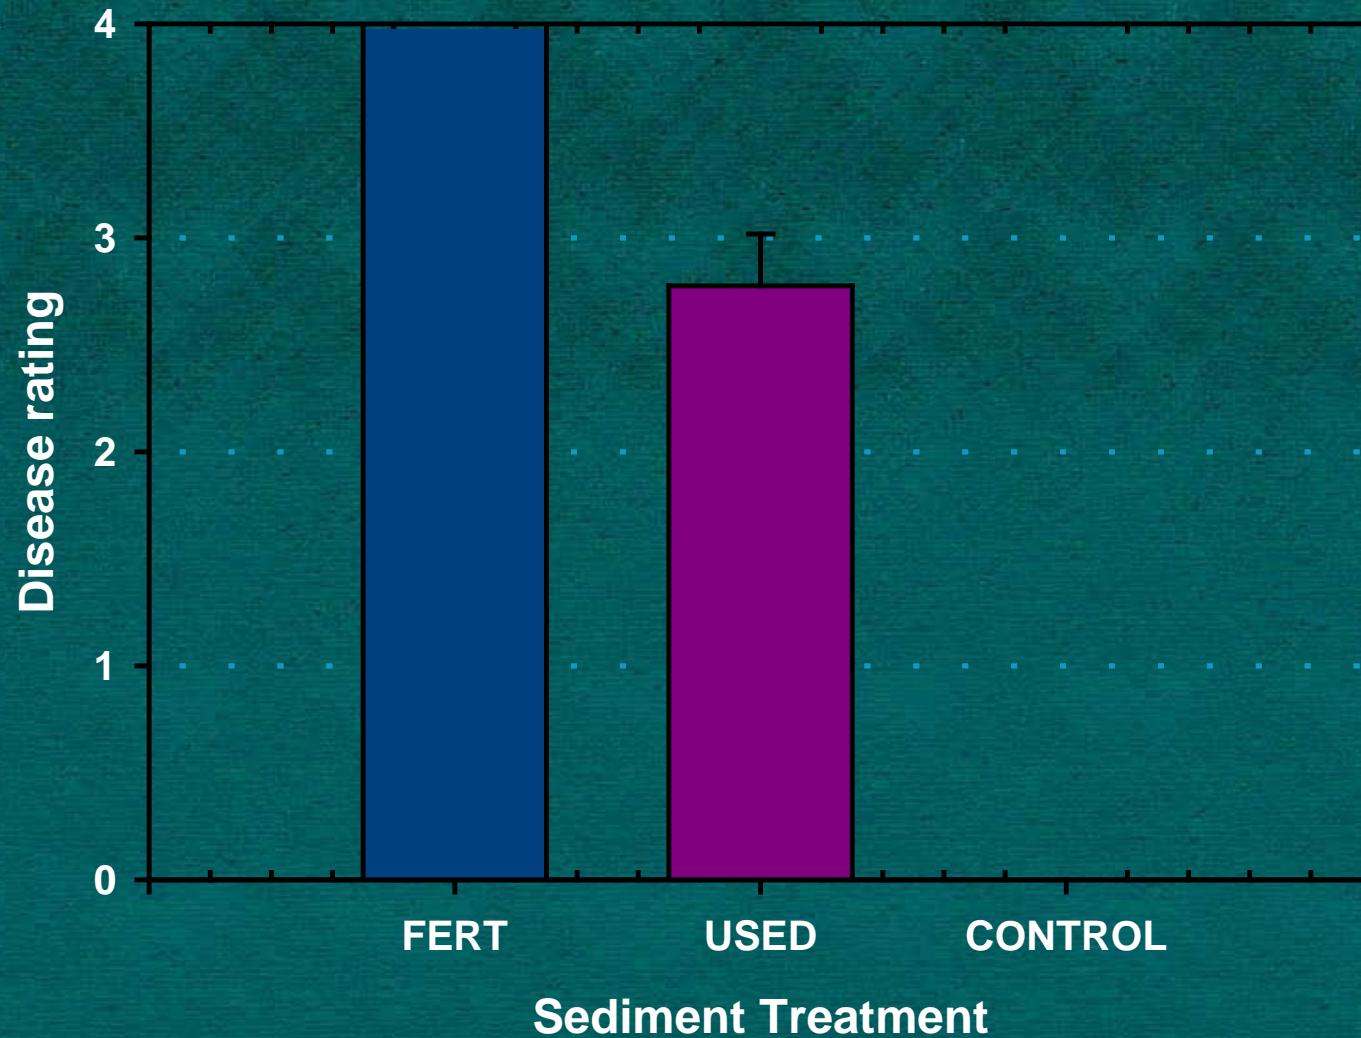

Methods

- In each container:
 - 250 ml flask
 - 150 ml deionized water
 - 1 to 5 cm hydrilla sprig
- Inoculated with:
 - Liquid Mt
 - Rate = 0.1 ml/L

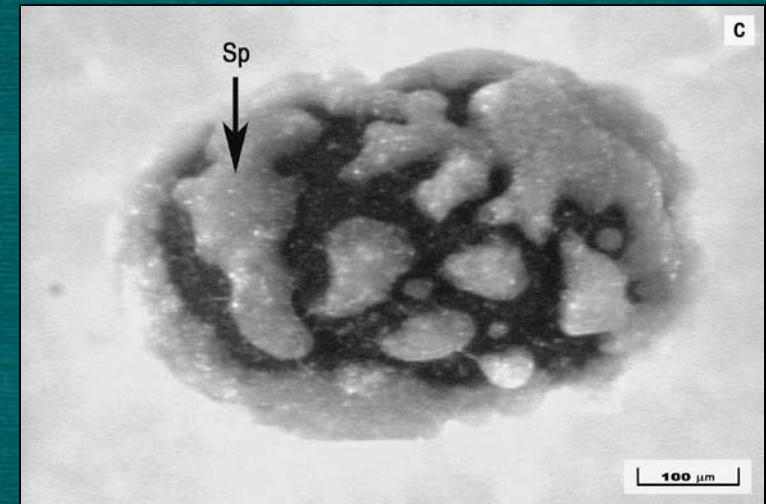

**Disease rating of hydrilla sprigs 14 days post inoculation
with *Mycoleptodiscus terrestris*: 4 = tissues disintegrated;
3 = chlorotic and flaccid; 2 = chlorotic; 1 = slight chlorosis;
0 = green and healthy**

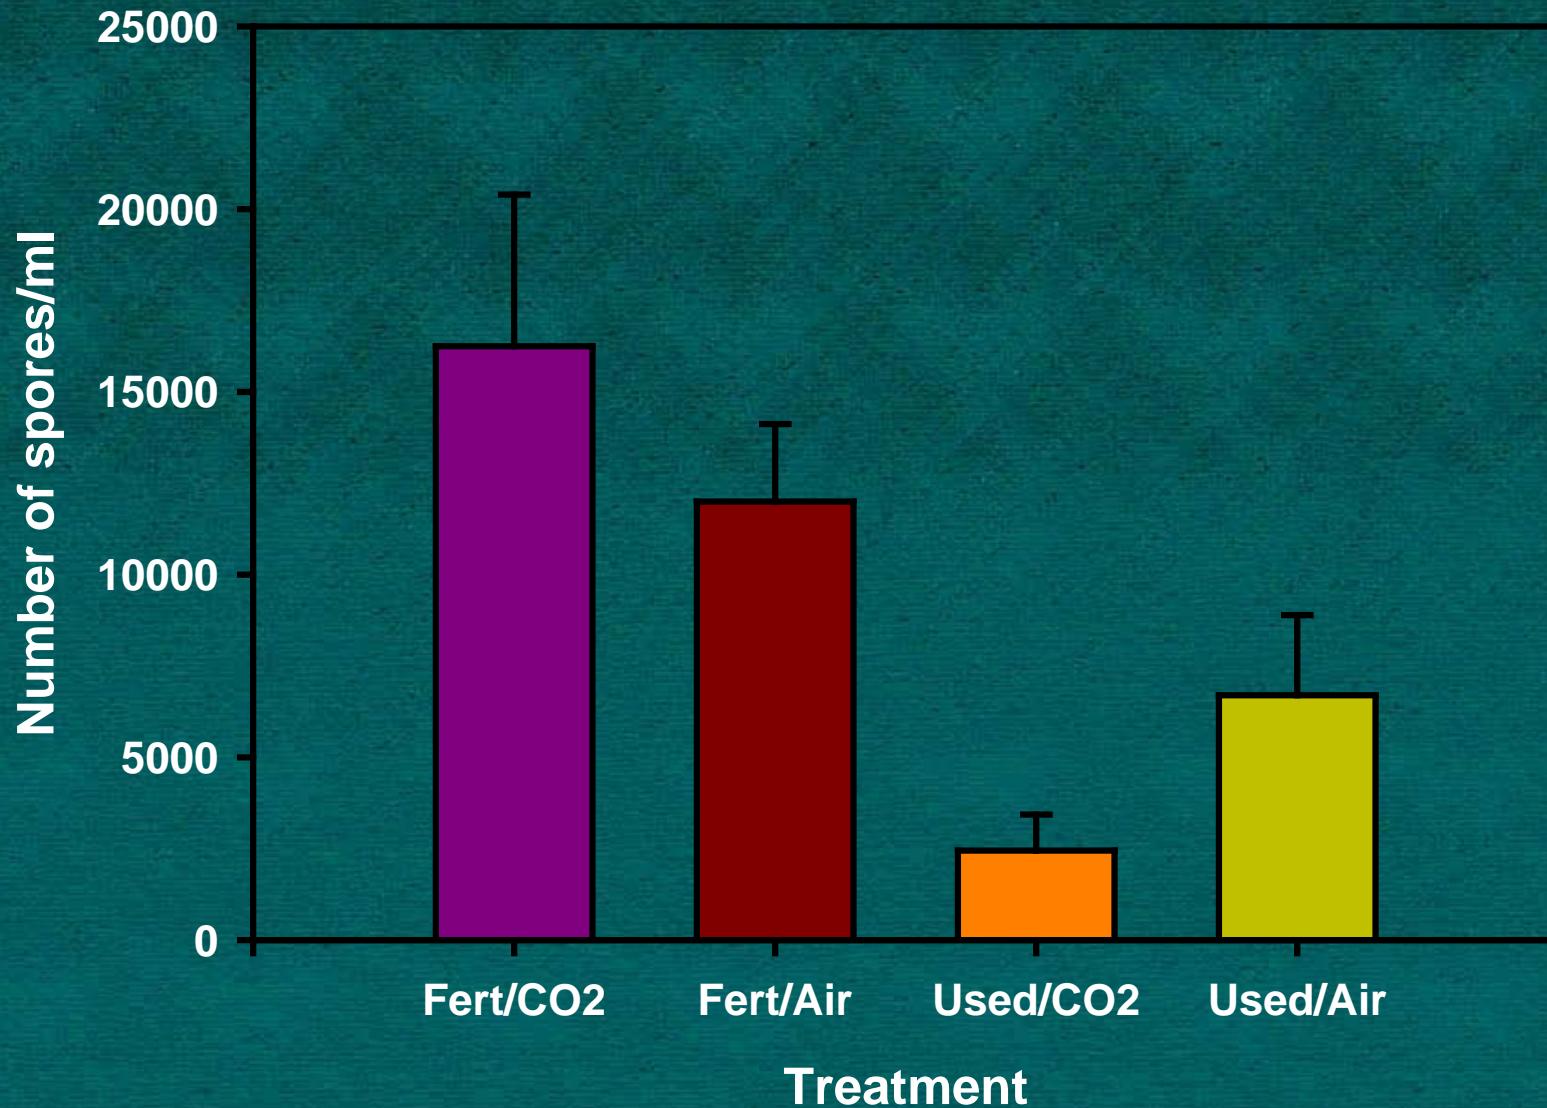

Mycoleptodiscus terrestris

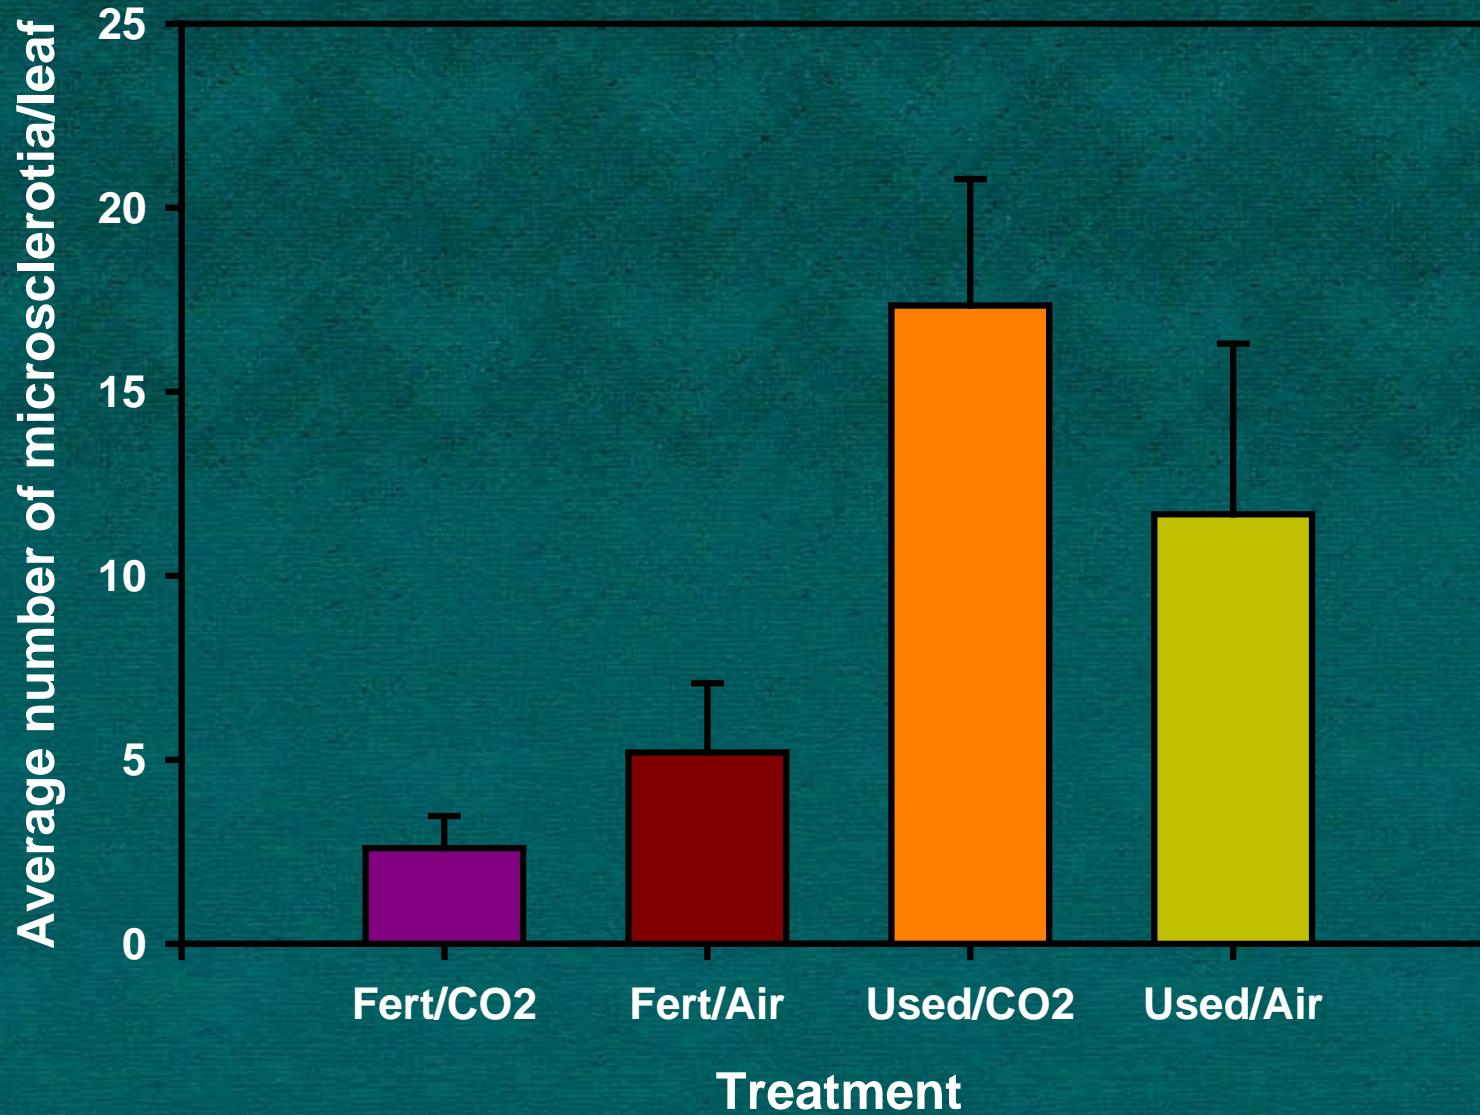

- Two structures
 - Spores
 - Reproduction
 - Unicellular or multicellular
 - Reproductive
 - Distributional cells
 - Microsclerotia
 - Survival
 - Multicellular
 - Hard
 - Resistant
 - Resting body

Number of spores/ml water containing a hydrilla sprig 14 days post inoculation with Mt

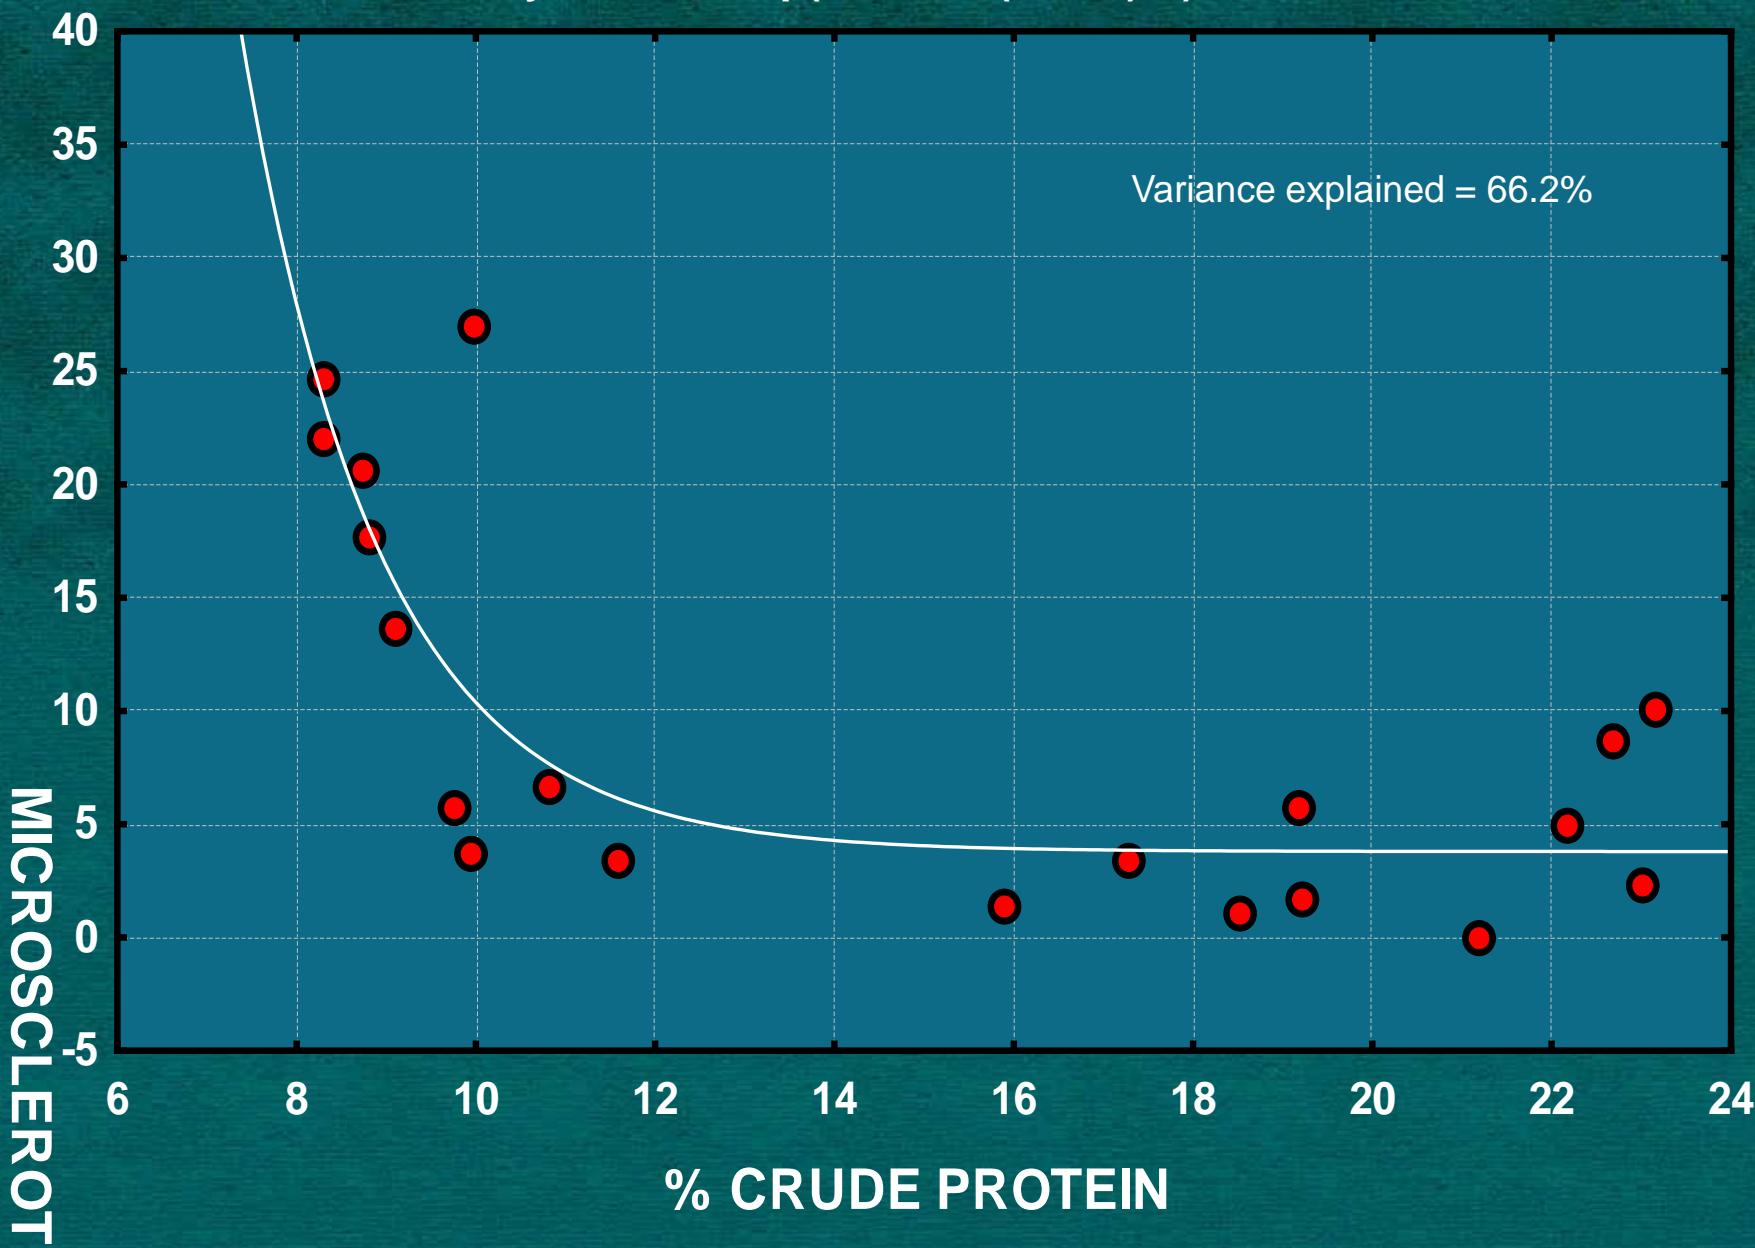

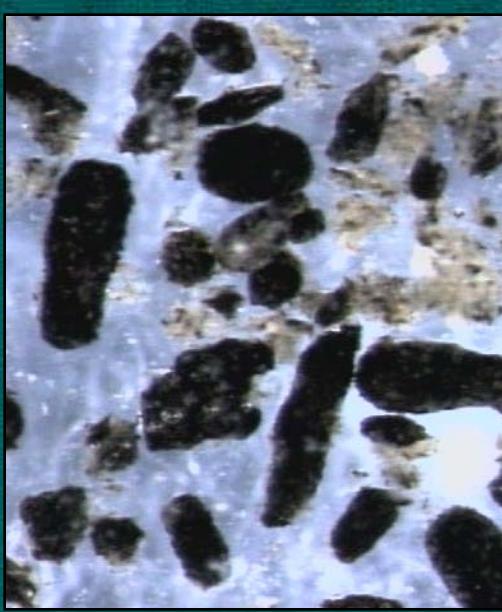

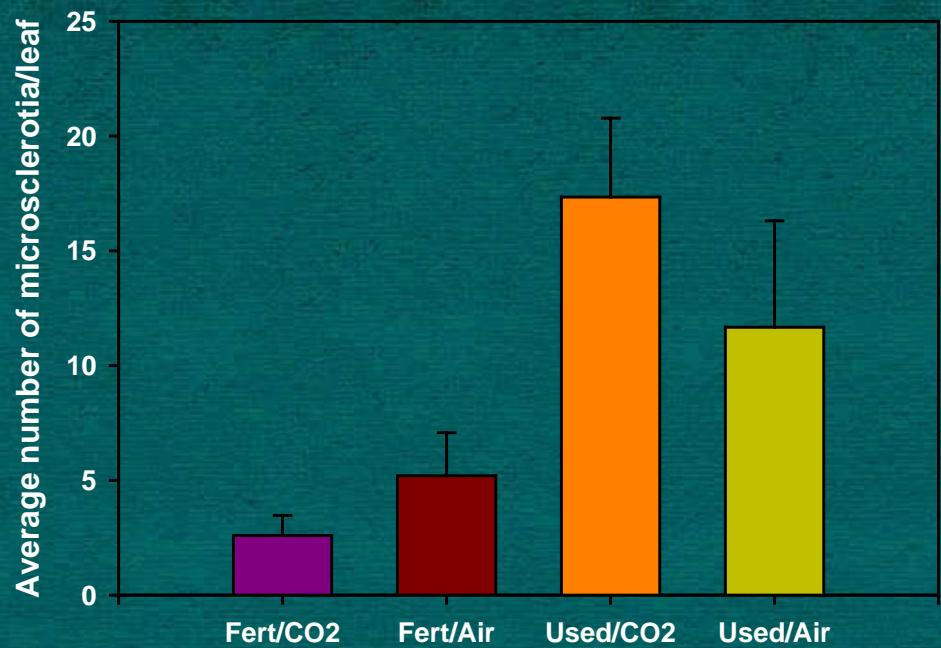

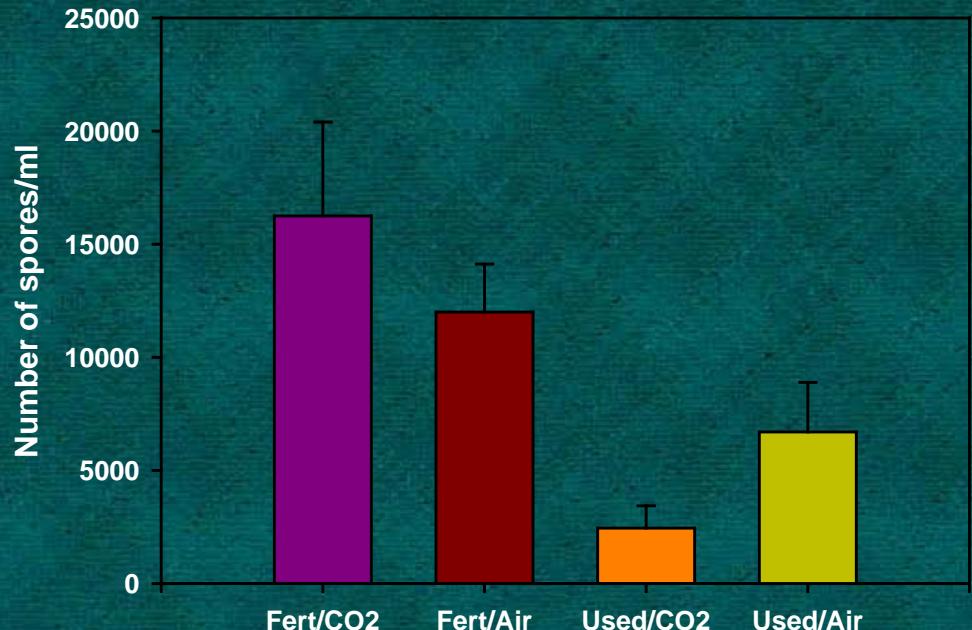

Average number of microsclerotia/leaf 14 days post inoculation with Mt

Model: Exponential growth ($y=c+\exp(b_0+b_1*x_1+b_2*x_2 \dots)$)

$$y=3.7951+\exp(8.38821+(-.6504)*x)$$

Plant nutrition

High protein

- *H. pakistanae*

- *M. terrestris*

- Increased damage

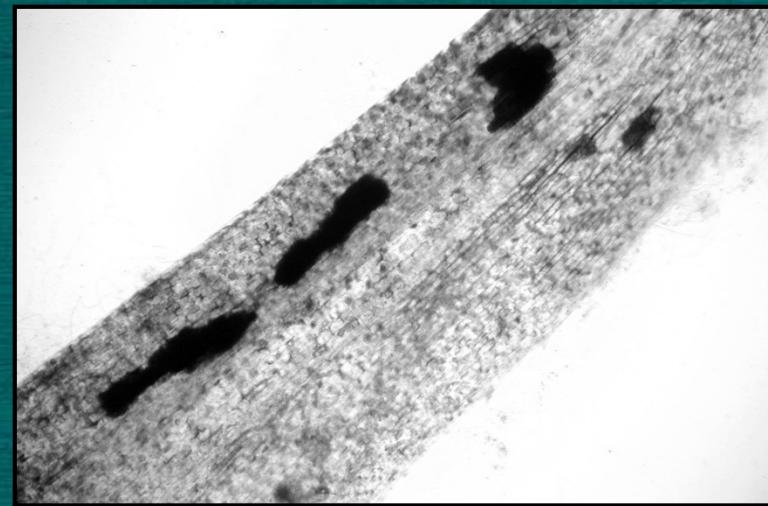

- Increased disease

Plant Nutrition Low protein

- *H. pakistanae*
 - Fewer eggs
 - Smaller females
 - Promotes insect dispersal
- *M. terrestris*
 - Fewer spores
 - Fewer sporodochia
 - Shift to survival mode
