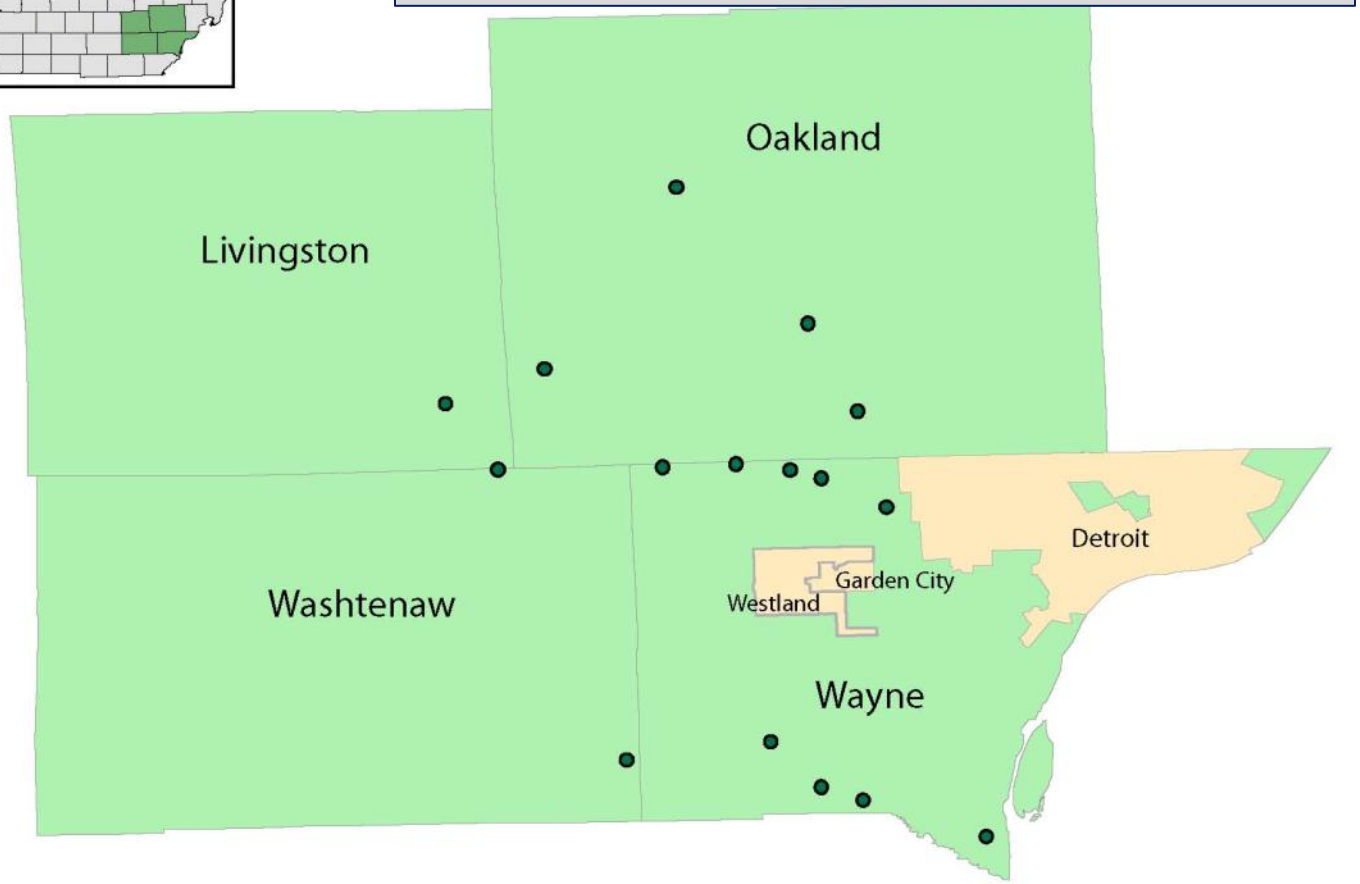
EAB natural enemy survey sites in southeast Michigan 2003-2004



Natural Enemy Survey of EAB Natural Enemies in SE Michigan: 2002-2004

<1% parasitism across all sites sampled

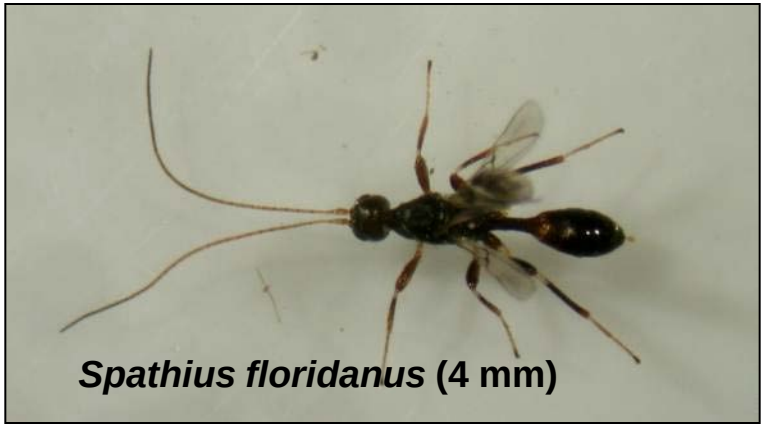
Phasgonophora sulcata (8 mm)

Chalcididae

Atanycolus spp. (12 mm)

Balcha indica (7-9 mm) (exotic)

Eupelmidae



Spathius floridanus (4 mm)

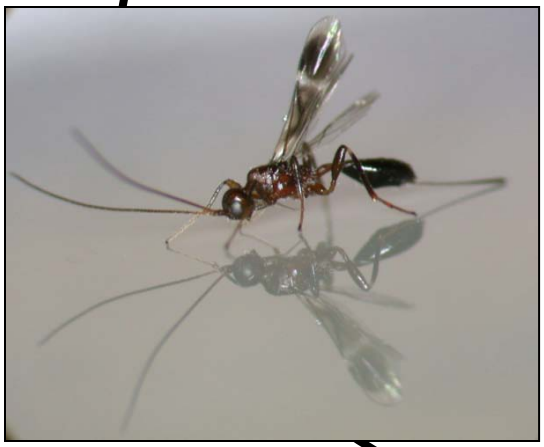
Braconidae

Provinces in China Surveyed for Ash, EAB, Natural Enemies: 2003-2005

Life Cycle of *Oobius agrili* (Hymenoptera: Encyrtidae), a solitary & parthenogenic EAB egg parasitoid

Life cycle of *Tetrastichus planipennisi* (Hymenoptera: Eulophidae), a gregarious larval endoparasitoid of EAB

Life cycle of *Spathius agrili* (Hymenoptera: Braconidae), a gregarious larval ectoparasitoid of EAB



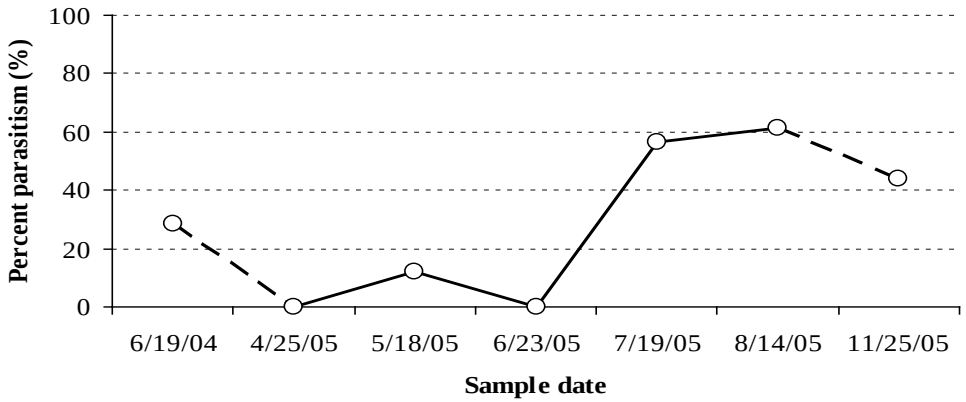
Fraxinus pennsylvanica (green ash) planted in China

~74% EAB-population reduction by combined effect of *Oobius agrili* and *Tetrastichus planipennisi**

EAB egg parasite:

***O. agrili* –**

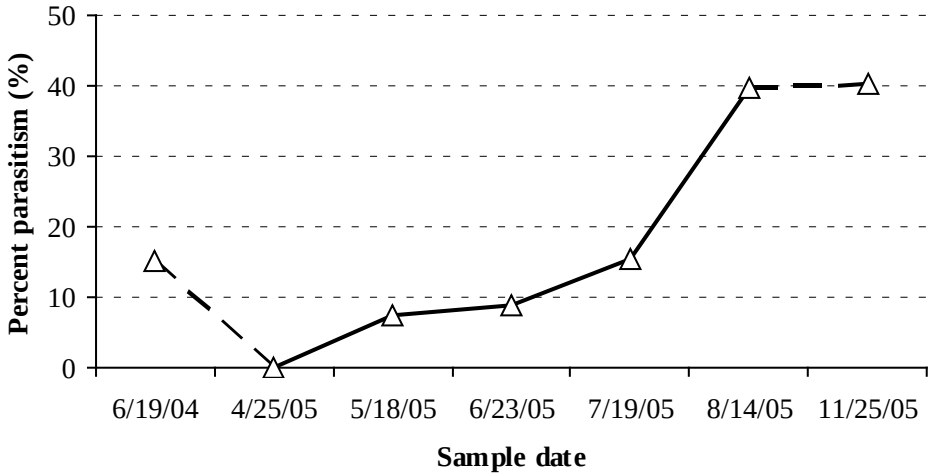
average 36.5% parasitism



EAB larval parasite:

***T. planipennisi* –**

average 22.4% parasitism



*Liu & Bauer. 2007. Biological Control. 42: 61-71

Summary of Host Specificity Studies

Parasitoid Species	No-choice Assays (family or genus)	Species (n)	Host Accept (n)	Choice Assays (n spp.)	Olfacto-metry	Survey in China
Oobius	***Agrilus***	6	3	3	No	No
	Cerambycidae	2	-	-		
	Lepidoptera	4	-	-		
	Total	12				
Tetrastichus	***Agrilus***	5	-	No	No	Yes
	Chrysobothris	3	-			
	Cerambycidae	5	-			
	Tenebrio	1	-			
	Lepidoptera	2	-			
	Hymenoptera	1	-			
	Total	17				
Spathius	***Agrilus***	9	4	No	Yes	Yes
	Cerambycidae	3	-			
	Lepidoptera	6	-			
	Curculionidae	1	-			
	Total	19

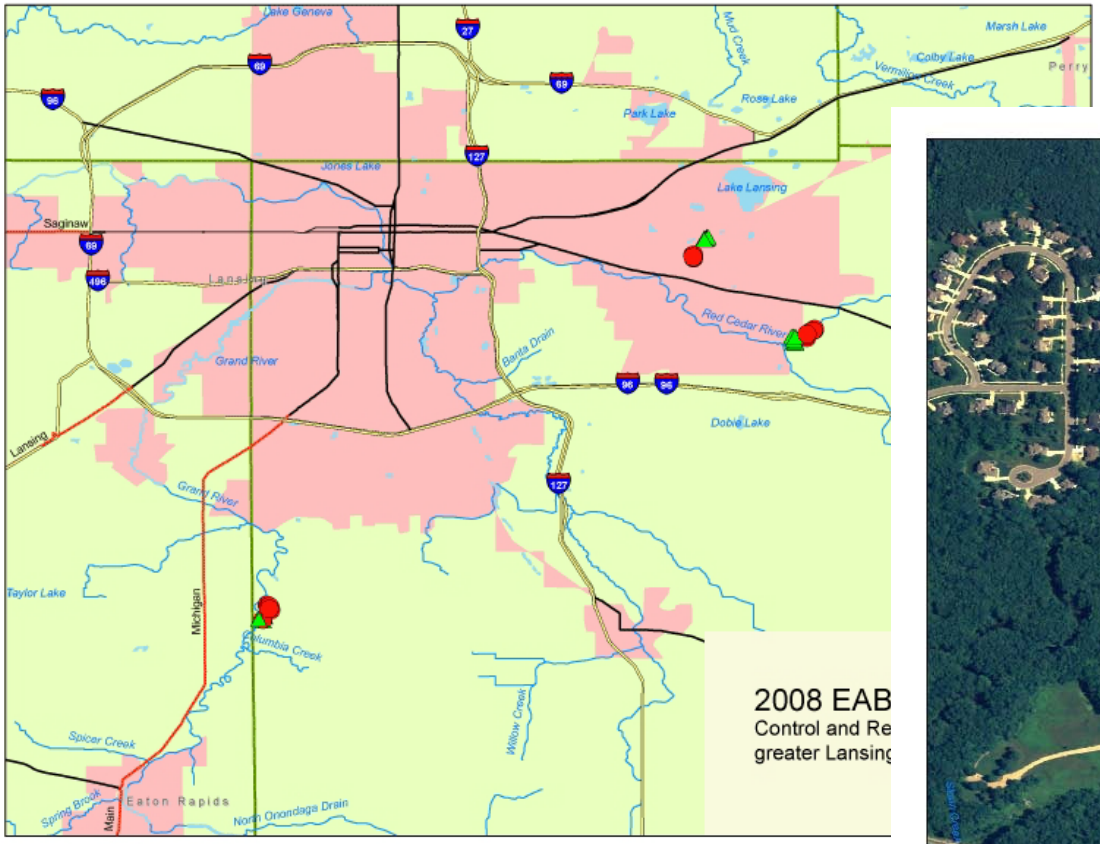
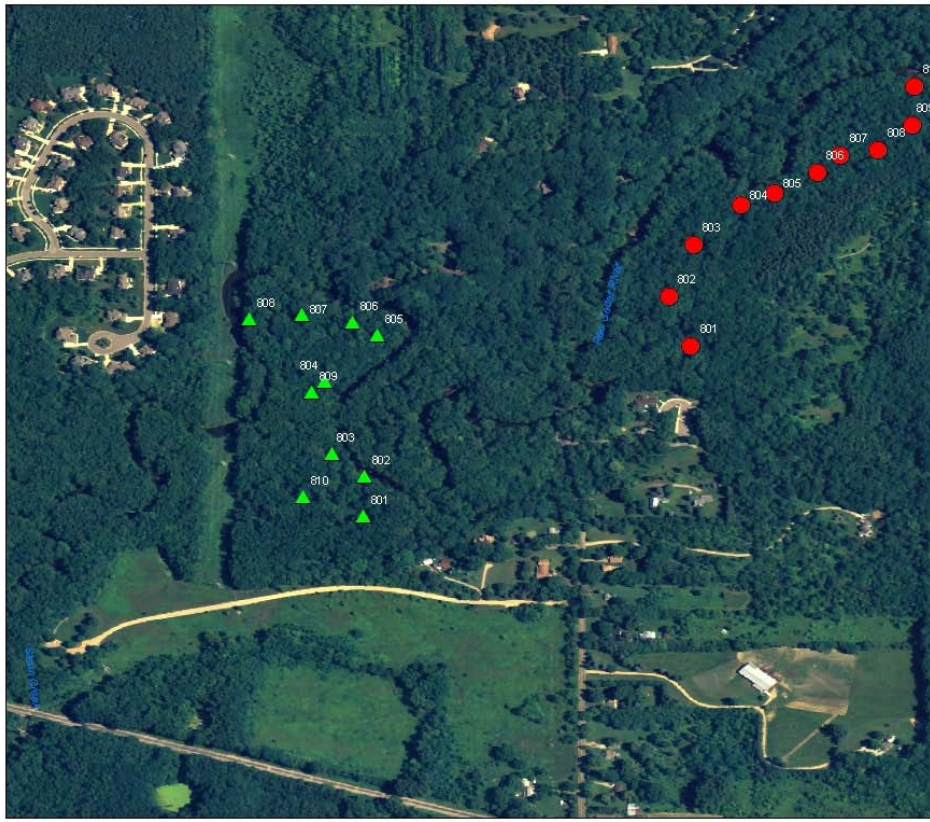
Evaluation of Introduced Parasitoids for Biocontrol of EAB in MI

- Monitor the establishment
- Quantify the impact or contribution to EAB mortality

Study Site and Sampling Tree Maps





Parasitoid Releases

Species	2008 – Per Site	2009 – Per Site
O. agrili (F) 	100 – one release: June-July	**300** - one release: June-July
S. agrili (F) 	80 –One release: late Sept.	**600** – two releases: July - August
T. planipennisi (F) 	100 – One release: late Sept.	**3200** - 41 releases: June - September

Sampling Approaches

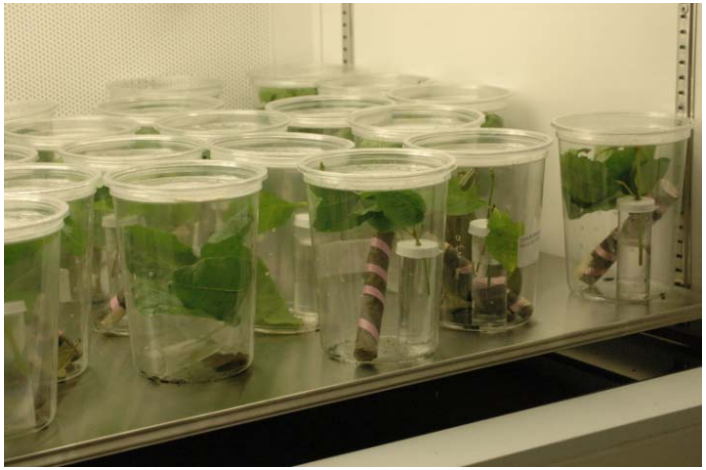
- Collecting EAB eggs, larvae, and associated parasitoids by destructively sampling EAB infested trees
- Using the **real cohort or cohort populations established over a course of time**
  - measure parasitism and its contribution on EAB population dynamics

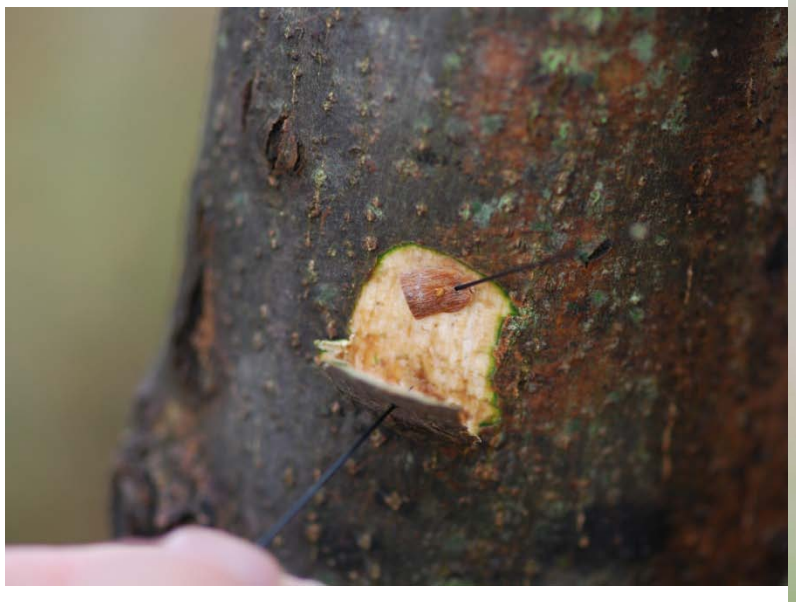
Challenges in Sampling EAB and Its Parasitoids

- Immature stages living in concealed habitat
- One to two years/generation

Survey for naturally occurring EAB eggs to evaluate egg parasitoid

Lab-reared EAB eggs placed in the cut crevice of the tree trunk





Egg/larval cohorts from caged adults

Sampling EAB larvae and associated Parasitoids

- Trunks (0 – 2.5 m above the ground) completely debarked
- Fate/Stage of EAB larvae and associated parasitoids were determined

Impact of the Egg Parasitoid – *Oobius agrili* (Encyrtidae)

Parasitism by *Oobius agrili:*
- naturally-occurring eggs

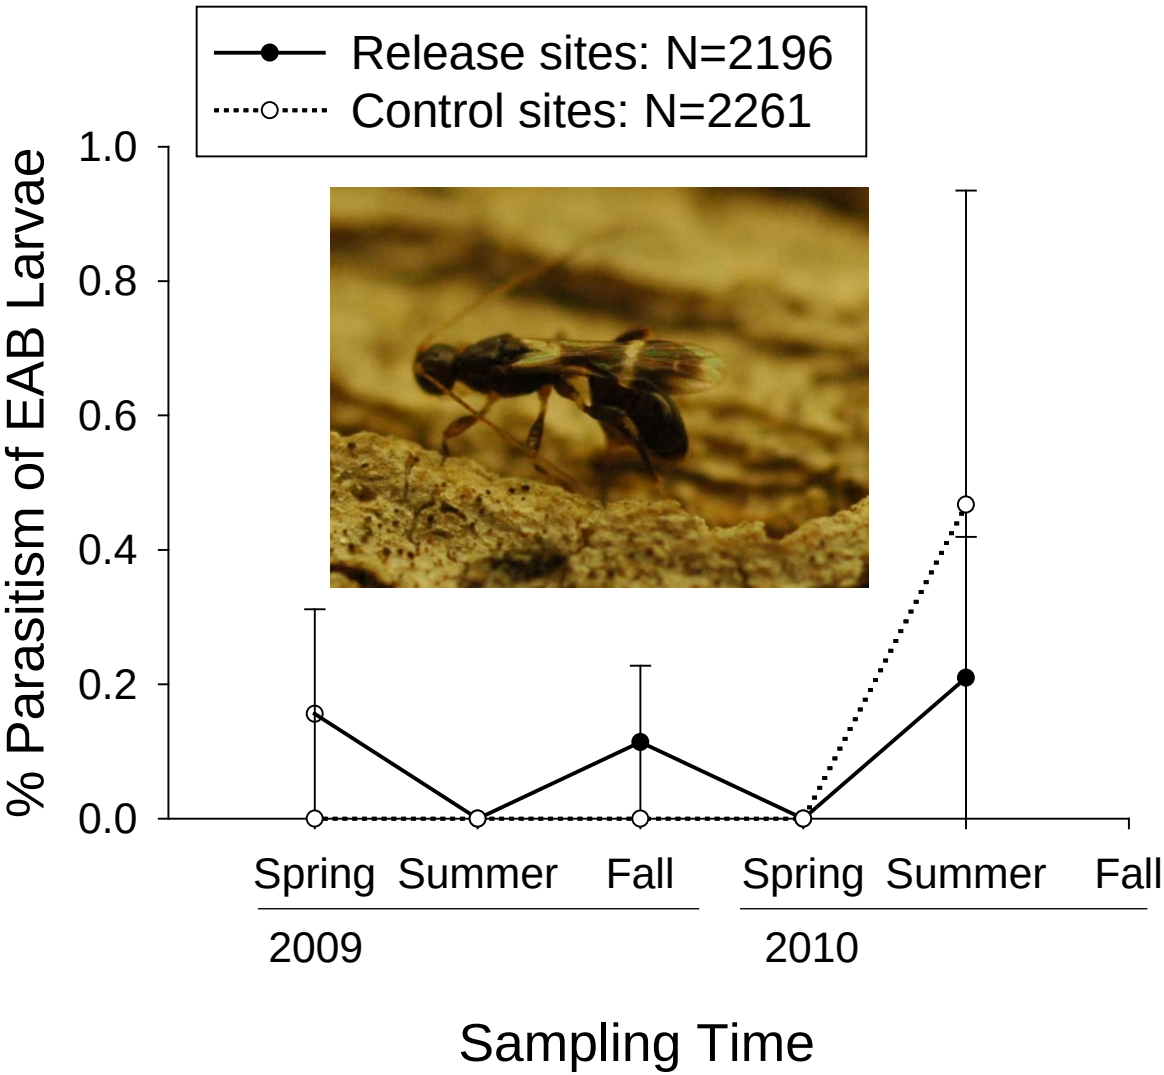
TRT	**2008 (P/N)**	**2009 (P/N)**
Release	2 /175 (1.1%)	11 /261 (4.2%)
Control	0 /123	0 /420

Impact of Larval parasitoids

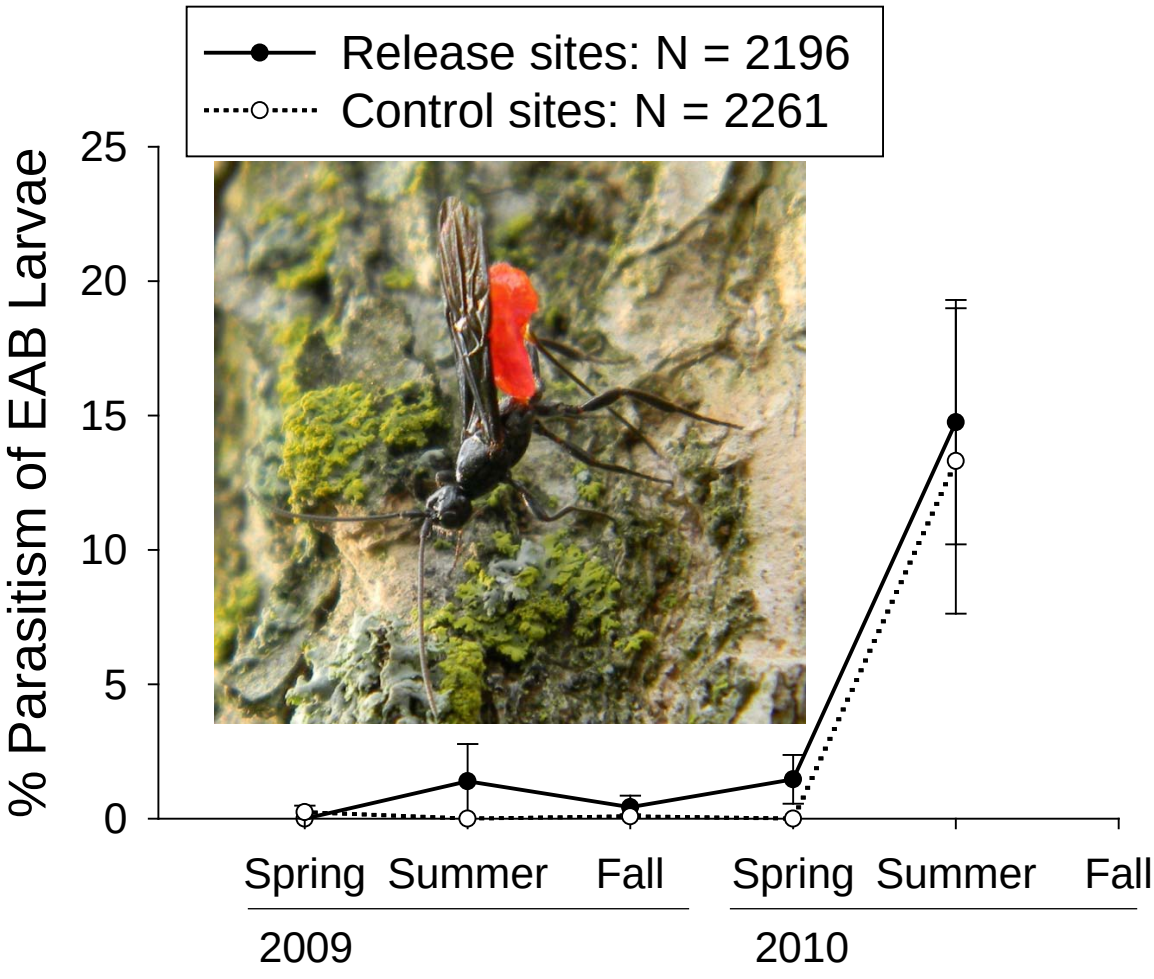
- *Tetrastichus planipennisi & Spathius agrili*

Tetrastichus planipennisi

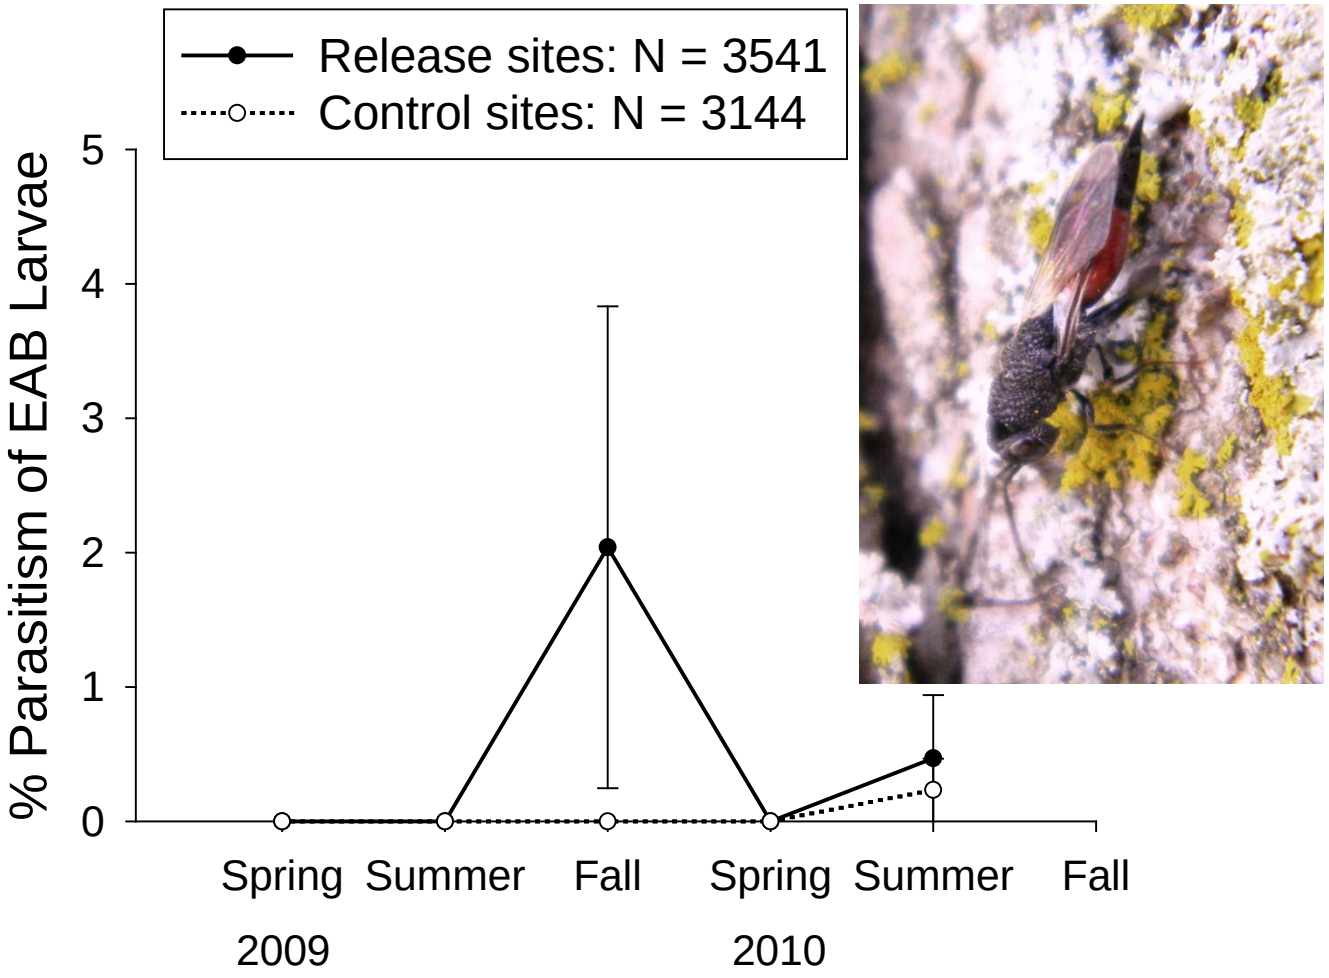
Spathius spp.



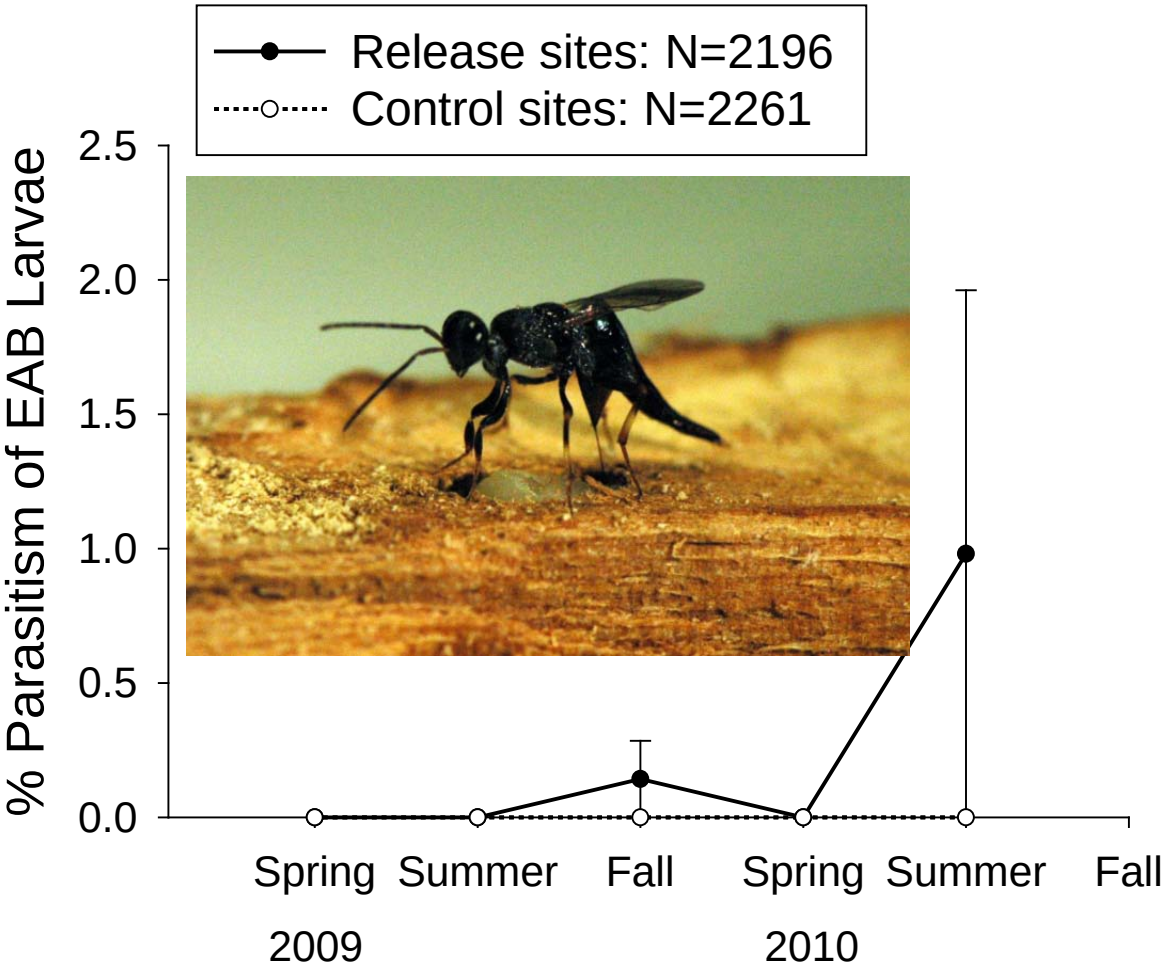
Atanycolus spp.



Phasgnophora sulcata



Balcha indica



Duan et al. 2010 – Environ. Entomol (*in press*)

Will We Succeed in Biocontrol of EAB: Potential & Challenges

- Why EAB becomes a serious pest killing North American ash trees:
  - **Parasitoid lost:**
    - Parasitism in its native range is high:

      >74% in China (Liu et al 2007; Wang et al. 2010)

      >80% in the Russian far east (Duan unpublished)
    - Parasitism in North America has been low: <15%

Challenges in Successful EAB Biocontrol

- EAB population does have “Outbreaks” on North American ash species *Fraxinus pennsylvanica* in Asia

Host Plant Resistance May Play a Key Role in Reducing Ash Tree Mortality

>80% larval parasitism by *Spathius* sp & *Atanycolus* sp

Perspective of EAB Biocontrol

- Ecological basis is partly supported by data
- Biocontrol can be important tool in reducing the EAB population. It will be challenging to apply as a remedial measure to prevent tree mortality.

Recommendations for Implementation of EAB Biocontrol

- Continue field releases/evaluations at the selected sites
- Explore for new guilds of natural enemies in native range
- Understand EAB population dynamics in both its native range (Asia) and new home (North America)
